

4-channel BTL driver for CD players

BA6897S/BA6897FP

The BA6897S and BA6897FP are a 4-channel BTL driver for CD player motors and actuators. It has an internal 5V regulator and standard operational amplifier, and is suited to a wide range of applications.

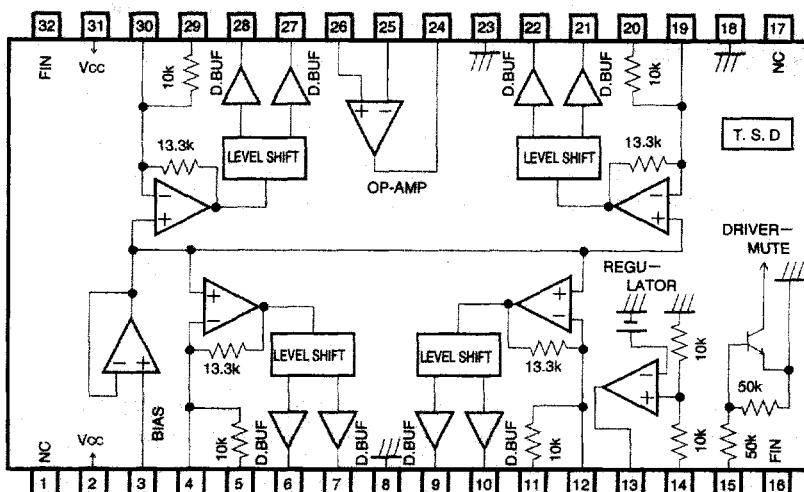

● Applications

CD players, CD-ROM drives

● Features

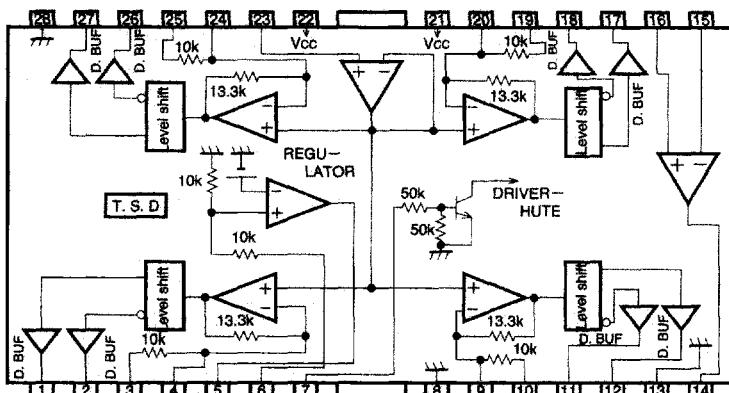

- 1) Minimal number of external components.
- 2) Driver gain is adjustable with just one attached resistor.
- 3) Internal 5V regulator (attached PNP transistor necessary)
- 4) Internal standard operational amplifier.
- 5) Internal thermal shutdown circuit.

●Circuit operation

1. Driver

Inputs to the IC are the focus tracking error signal from the servo preamplifier and the control signal from the motor.

The input signals, which normally center on 2.5V, are V/I converted by the preamplifier, generating a current corresponding to the input voltage. This current is passed through a resistor and into the internal reference voltage component, the preamplifier output being a signal centering on the internal reference voltage. Two systems (positive phase and negative phase) are created during V/I conversion, generating BTL output via the driver buffer.

2. Regulator

This is a typical series regulator that generates a reference voltage internally. A PNP low saturation transistor must be connected.

● Operation notes

1. The BA6897S and BA6897FP have an internal thermal shutdown circuit. Output current is muted when the chip temperature exceeds 175°C (typically).
2. If the mute pin voltage is opened or lowered below 0.5V, the output current will be muted. The mute pin should be pulled up above 2.0V during normal use.
3. The bias pin is muted when lowered below 1.4V (typically). Make sure it stays above 1.6V during normal use.
4. Muting occurs during thermal shutdown, mute-on

operations or a drop in the bias pin voltage or supply voltage. In each case, only the drivers are muted. During muting, the output pins remain at the internal bias voltage, roughly $(V_{CC} - V_F)/2$.

5. Be sure to connect the IC to a $0.1 \mu F$ bypass capacitor to the power supply, at the base of the IC.
6. The radiating fin is connected to the package's internal GND, but should also be connected to an external ground.
7. The capacitor between regulator output (pin 6) and GND also serves to prevent oscillation of the IC, so select one with good temperature characteristics.
