Feature List

The ES9027PRO is a SABRE 8 channel high performance digital to analog converter (DAC) with features and performance including the new Hyperstream IV modulator that produces a device that is well suited for all Audiophile and PRO Audio applications.

These features include TDM & SPI support as well as Hardware (HW) mode for simplifying configuration of the ES9027PRO.

TDM / I²S / LJ / RJ / DSD / DoP & S/PDIF interfaces are supported.

Sample rates up to 768kHz with PCM data and DSD rates up to DSD1024 are supported. 7 Selectable built-in digital filters are also available.

Configuration Modes

The ES9027PRO supports 2 different software modes (SPI or I²C) and supports 2 different sets of hardware modes (PCM or TDM/DSD). They are controlled by the state of the MODE Pin (Pin 17).

Mode Pin	Configuration
0	I²C Interface
Pull Low	HW control mode (see Hardware Mode Table)
Pull High	HW control mode (see Hardware Mode Table)
1	SPI interface

Table 2 - Configuration Mode

Design Information

Hardware pins can be configured in 4 different ways. Each pin can be tied-high (1), pulled-high (Pull 1), pulled-low (Pull 0), or tied-low (0). HW0 and HW1 pins are always tied-high or tied-low. This also applies to MUTE_CTRL.

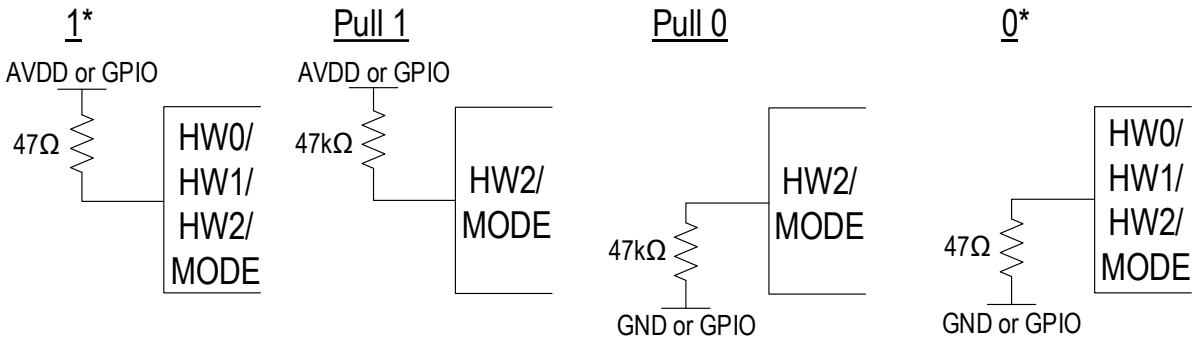

Figure 3 - Hardware Mode Pin Configurations

* Note: Hardware mode pins states 0 and 1 can be directly connected to GND or AVDD.

Software Mode

The ES9027PRO supports I²C or SPI serial communication. The ES9027PRO has read/write registers and read-only registers. Software modes are set with the MODE pin (Pin 17).

I²C Slave Interface Commands

The I²C slave interface is used when the MODE pin (Pin 17) is tied low (MODE=0). In I²C mode, ADDR1 (Pin 30) and ADDR0 (Pin 31) determine the I²C address and the R/W bit controls reading or writing.

For I²C Timing information, see Timing Characteristics.

The I²C Slave Interface can be accessed by:

- Pin 15 SDA
- Pin 16 SCL
- Pin 30 ADDR1
- Pin 31 ADDR0

I²C Slave Address = [5'b10010, ADDR1, ADDR0, R/W]

I²C Slave Address	ADDR1	ADDR0
0x90	0	0
0x92	0	1
0x94	1	0
0x96	1	1

Table 3 - I²C Slave Addresses

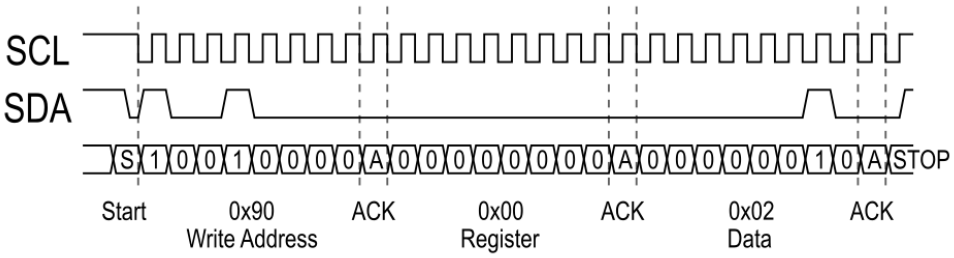

Figure 4 - I²C Write Example

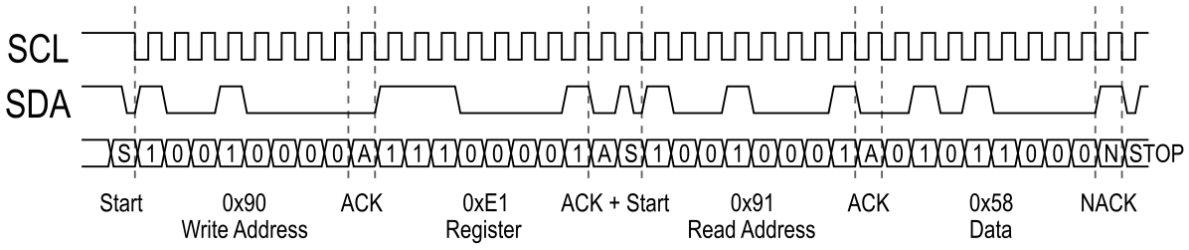

Figure 5 - I²C Read Example

Note: All bus transitions between start and stop must be part of the transaction when writing to the ESS device

SPI Slave Interface Commands

The Slave Serial Peripheral Interface (SPI) is used when the MODE pin (Pin 17) is tied high (MODE=1).

The SPI slave interface can be accessed using Pins 15, 16, 30, and 31:

- Pin 15 MOSI
- Pin 16 SCLK
- Pin 30 SS
- Pin 31 MISO

The 4-wire SPI data format is: Command (1 byte) + Address (1 byte) + Data.
SPI Commands:

- 0x01 Read
- 0x03 Write

For SPI Timing information, see Timing Characteristics.

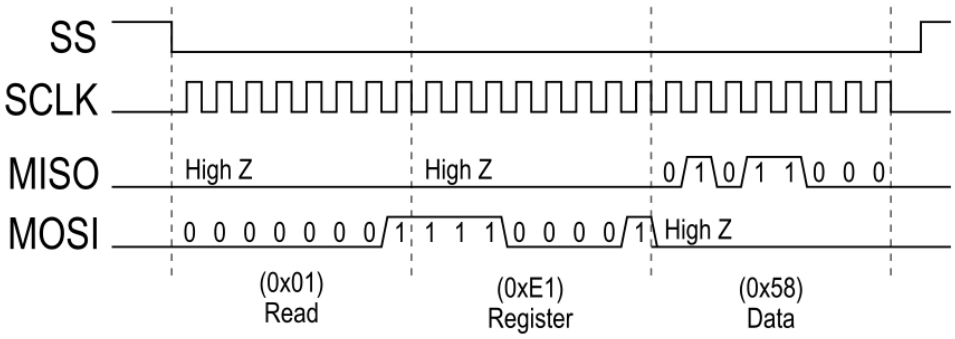

Figure 6 – SPI Single Byte Read

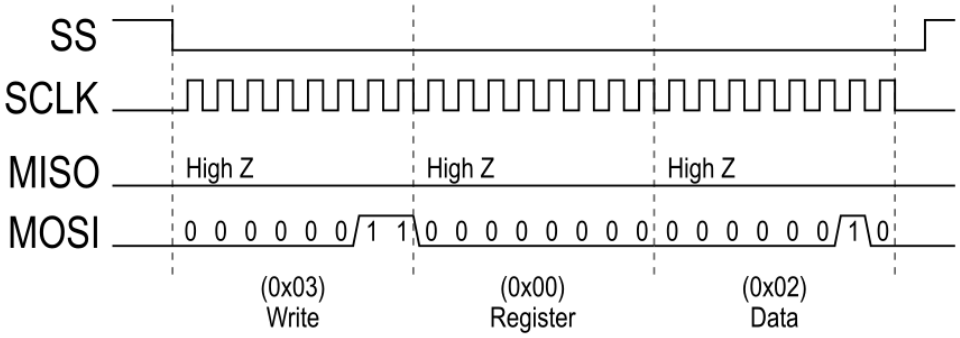

Figure 7 – SPI Single Byte Write

Hardware Mode

The ES9027PRO has 32 pre-configured modes that can be set with external pin configuration. These modes configure the DAC for different input serial data rates and set the DAC muting.

These modes are set with pins:

- MODE (Pin 17)
- HW0 (Pin 15)
- HW1 (Pin 16)
- HW2 (Pin 17)
- MUTE_CTRL (Pin 31)

Recommended Hardware Mode Startup Sequence

The hardware mode setup sequence is shown below with all hardware pins being defined after CHIP_EN is asserted.

Note: It is recommended that MUTE_CTRL is set low until CHIP_EN is asserted, then asserted last to unmute the DAC.

Table 4 - Hardware Mode Pin Configurations

[1] For S/PDIF in HW mode, DATA7/GPIO7 is the S/PDIF stream input. The ES9027PRO must be reset (CHIP_EN) when changing to and from S/PDIF.

[2] To enable DoP in HW mode, DATA8/GPIO8 pin must be high. S/PDIF will be auto detected.

[3] TDM uses auto channel detect to determine the amount of channels. 8 Channels of data on a single data line is required in hardware mode to map to all 8 DACs. In software mode, 4 channels on 2 data lines is also supported.

Audio Input Formats

The ES9027PRO supports multiple serial input data formats. Input format is selected either through Hardware Mode or Software Mode.

The ES9027PRO can automatically determine the input data format by enabling Register 57[0] AUTO_INPUT_SEL, data must be provided on the DATA2 pin, to properly decode the input format. The input data format can also be selected using Register 57[2:1] INPUT_SEL.

For Hardware Mode see Table 4 - Hardware Mode Pin Configurations for inputs.

The formats include:

- PCM
  - Slave and master mode in 16, 24, 32-bit widths
  - I^2S, Left Justified (LJ), and Right Justified (RJ)
  - TDM up to TDM1024 mode with 32 slots including daisy chain mode

In hardware mode, PCM (I²S/LJ) data lines are fixed to the mapping shown in the table below.

In software mode, PCM (I²S/LJ) data lines can be re-mapped to any DAC.

PCM Pin Connections (default configuration):

Pin Name	Function	Description
DATA_CLK	PCM BCLK	PCM Clock (Bit Clock), Master or Slave
DATA1	PCM WS	PCM WS (Word Select/Frame Select), Master or Slave
DATA2	PCM DATA	PCM Data Channel 1 & 2
DATA3	PCM DATA	PCM Data Channel 3 & 4
DATA4	PCM DATA	PCM Data Channel 5 & 6
DATA5	PCM DATA	PCM Data Channel 7 & 8

Table 7 - PCM Pin Connections

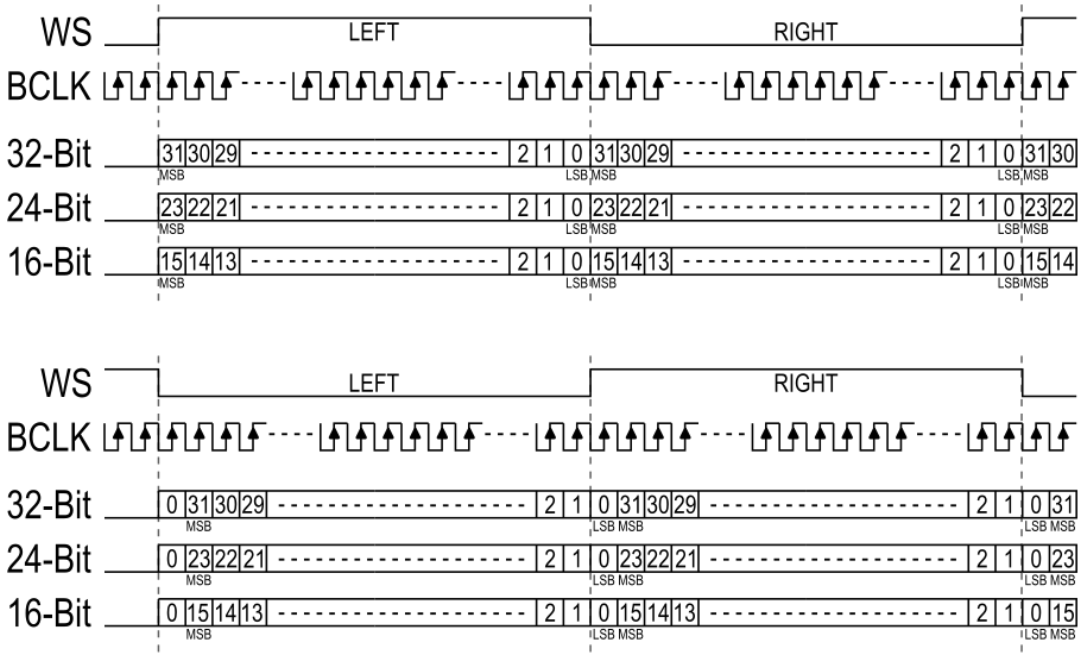

Figure 9 - LJ (top) & I²S (bottom) for 16,24, and 32-bit Word Widths

TDM (Time-Division Multiplexing)

ES9027PRO supports time-division multiplexing (TDM) format, allowing more than 2 channels (or slots) to be transmitted on each data line, up to a maximum of 32 channels per data line. Typical formats are TDM128 (4chx32bit), TDM256 (8chx32bit), TDM512 (16chx32bit) and TDM1024 (32chx32bit). DSD[1]

In DSD mode, there is a single DSD clock line, and each channel of data is an additional DSD data line. There is no internal channel mapping for DSD input, DSD data input to DATA1 is sent to Ch1, DSD data input to DATA2 is sent to Ch2, etc.

For 4 channel and 2 channel applications, the interpolation path data can be copied from DAC1+DAC2 to the other DAC pairs, see Register 0[5:2] for details.

Data lines in hardware mode use the default configuration.

DSD Pin Connections (default configuration):

Pin Name	Function	Description
DATA_CLK	DSD CLK	DSD Clock
DATA1	DSD CH1	DSD DATA Channel 1
DATA2	DSD CH2	DSD DATA Channel 2
DATA3	DSD CH3	DSD DATA Channel 3
DATA4	DSD CH4	DSD DATA Channel 4
DATA5	DSD CH5	DSD DATA Channel 5
DATA6	DSD CH6	DSD DATA Channel 6
DATA7	DSD CH7	DSD DATA Channel 7
DATA8	DSD CH8	DSD DATA Channel 8

Table 9 - DSD Pin Connections

[1] The Automute Feature is not available when using DSD mode

S/PDIF

S/PDIF is transmitted over a single signal line using dual phase encoded data, which allows for clock extraction from the data signal line.

In S/PDIF mode, there is only stereo data input. Channel 1 data will be sent to all odd channel DACs, Channel 2 data will be sent to all even channel DACs.

Note: Toggle Register 58[6] BCK_INV after switching to S/PDIF input. A reset (CHIP_EN) is not required in SW mode as it is noted in Hardware (HW) mode.

Pre-Programmed Digital Filters

The ES9027PRO has 7 pre-programmed digital filters. The latency for each filter reduces (scales) with increasing sample rates. (See Register 88[2:0] FILTER_SHAPE for configuration)

#	Filter	Description
1	Minimum Phase (default)	Version 2 of minimum phase fast roll-off (#5) with less ripple and more image rejection
2	Linear Phase Apodizing Fast Roll-Off	Full image rejection by FS/2 to avoid any aliasing, with smooth roll-off starting before 20k.
3	Linear Phase Fast Roll-Off	Sabre legacy filter, optimized for image rejection @ 0.55FS
4	Linear Phase Slow Roll-Off	Sabre legacy filter, optimized for lower latency, but symmetric impulse response
5	Minimum Phase Fast Roll-Off	Low latency, minimal pre ringing and low passband ripple, image rejection @ 0.55FS
6	Minimum Phase Slow Roll-Off	Lowest latency at the cost of image rejection
7	Minimum Phase Fast Roll-Off Low Dispersion	Provides a nice balance of the low latency of minimum phase filters and the low dispersion of linear phase filters. Minimal pre-ringing is added to achieve the low dispersion in the audio band.

Table 10 - Pre-Programmed Digital Filter Descriptions

Note: Minimum phase filters are asymmetric filters that work to minimize the pre-echo of the filter, while still maintaining an excellent frequency response and they peak earlier than linear phase filters, resulting in a lower group delay. Minimum phase filters usually feature zero cycles of pre-echo, which can result in improved audio quality.

PCM Filter Latency

The following table shows the simulated latency of each filter at 44.1kHz sampling rate. Measurements were taken from the external impulse response. The extra sample delay to get the data encoded accounts for external processing time to serialize the data stream. Latency will reduce (scale) with sampling rate.

64FS Mode

When 64FS (MCLK/FS ratio) is required, it is necessary for the ES9027PRO to be running in 64FS Mode. 64FS Mode can be enabled by setting:

Software Register

- Register 0[6] ENABLE_64FS_MODE = 1'b1
  - Manually enables 64FS mode
  - Should be used with high samples rates 705.6kHz & 768kHz
- Register 3[7] AUTO_FS_DETECT = 1'b1
  - Auto tunes the CLK_DAC/CLK_IDAC ratio according to detected sampling frequency
  - Automatically enables 64FS mode when CLK_DAC/CLK_IDAC ratio is 64
  - Must be in SYNC mode

Note: 64FS mode is only supported is Software Mode (SW)

Minimum Phase 64FS Latency

The following table shows the simulated latency at 705.6kHz sampling rate and would be very similar at 768kHz. Measurements were taken from the external impulse response. The extra sample delay to get the data encoded accounts for external processing time to serialize the data stream. Latency delay will reduce (scale) with sampling rate.

Analog Features

Calibration Resistor

The ES9027PRO feature a ~100kΩ calibration resistor accessible through GPIO3 (Pin 22) and terminated to ground as shown in the below figure. The calibration resistor is enabled by default in both Hardware and Software Mode and can be disabled in SW Mode with Register 34[6] CAL_RES_ENB = 1.

ESS' ES9312 features a calibration mode that can be paired with the ES9027PRO to compensate AVCCL and AVCCR supplies. The ES9312 connects to the ES9027PRO integrated calibration resistor and adjusts the output supplies to maintain a tighter distribution on the output level in an application. See Recommended Power Supply for connections.

Register Overview

I²C Slave Interface

This interface uses device addresses 0x90-0x97 and contains Read/Write and Read-only registers. A system clock must be present.

Read/Write Register Addresses

Registers 0-141 (0x00 - 0x8D) are read/write registers.

Read-Only Register Addresses

Register 224-245 (0xE0 - 0xF5) are read-only registers.

Multi-Byte Registers

Multi-Byte registers must be written from LSB to MSB. Data is latched when MSB is written.
Multi-Byte registers must be read from LSB to MSB. Data is latched when LSB is read.
MSB is always stored in the highest register address.

Reflow Process Considerations

Temperature Controlled

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor to consider.

The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size (**Error! Reference source not found.**). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used.

Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (Table RPC-2).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

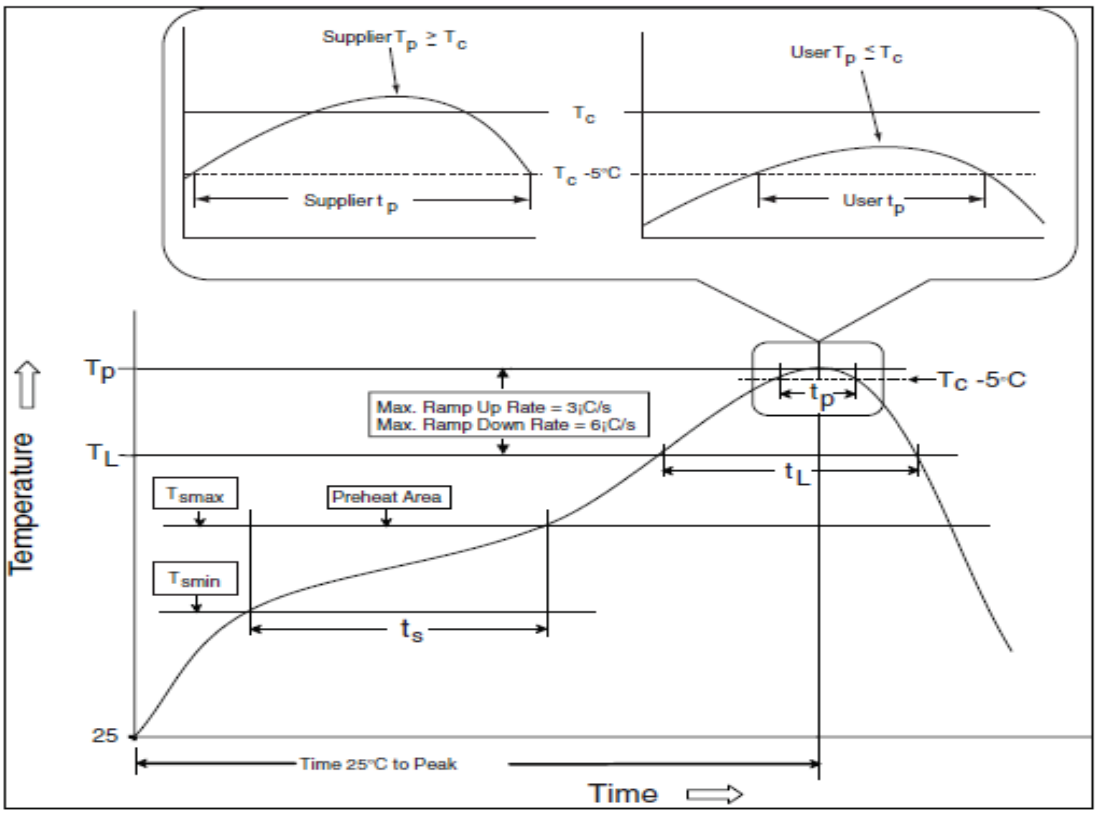

Figure 28 - IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time bake the board according to the moisture sensitivity label instructions.

Manual

Allowed up to 2 times with maximum temperature of 350ºC no longer than 3 seconds.

RPC-1 Classification Reflow Profile

Profile Feature	Pb-Free Assembly
Preheat/Soak Temperature Min (T_{SMIN}) Temperature Max (T_{SMAX}) Time (t_s) from (T_{SMIN} to T_{SMAX})	 150ºC 200ºC 60-120 seconds
Ramp-up rate (T_L to T_P)	3ºC / second maximum
Liquidous Temperature (T_L) Time (t_L) maintained above T_L	217ºC 60-150 seconds
Peak package body temperature (T_P)	For users T_P must not exceed the classification temp in Table RPC-2 For suppliers T_P must equal or exceed the classification temp in Table RPC-2
Time (t_P)* within 5ºC of the specified classification temperature (T_C)	30* seconds
Ramp-down rate (T_P to T_L)	6ºC / second maximum
Time 25ºC to peak temperature	8 minutes maximum
* Tolerance for peak profile temperature (T_P) is defined as a supplier minimum and a user maximum	

Table 32 - RPC-1 Classification Reflow Profile

All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), Tp shall be within ±2°C of the live-bug Tp and still meet the Tc requirements, otherwise, the profile shall be adjusted to achieve the latter. To accurately measure actual peak package body temperatures, refer to JEP140 for recommended thermocouple use.

Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if T_C is 260ºC and time t_P is 30 seconds, this means the following for the supplier and the user.
For a supplier, the peak temperature must be at least 260ºC. The time above 255ºC must be at least 30 seconds
For a user, the peak temperature must not exceed 260 ºC. The time above 255 ºC must not exceed 30 seconds.

All components in the test load shall meet the classification profile requirements.

RPC-2 Pb-Free Process - Classification Temperatures (T_C)

Package Thickness	Volume mm3, <350	Volume mm3, 350 to 2000	Volume mm3, >2000
<1.6 mm	260°C	260°C	260°C
1.6 mm – 2.5 mm	260°C	250°C	245°C
>2.5 mm	250°C	245°C	245°C

Table 33 - RPC-2 Pb Free Classification Temperature

At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (Tp) can exceed the values specified in Table RPC-2. The use of a higher Tp does not change the classification temperature (Tc).

Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or nonintegral heat sinks.

The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.
