■ PIN ASSIGNMENTS

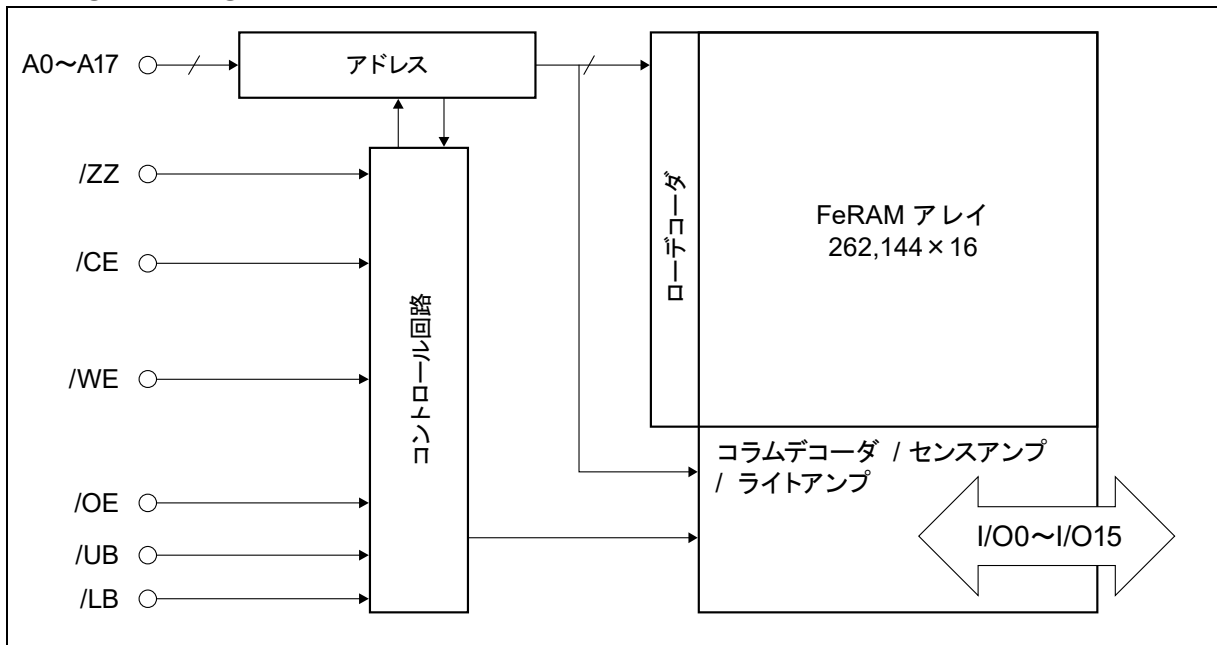

■ PIN DESCRIPTIONS

Pin Number	Pin Name	Functional Description
1 to 5, 18 to 22, 23 to 27, 42 to 44	A0 to A17	Address Input pins Select 262,144 words in FeRAM memory array by 18 Address Input pins. When these address inputs are changed during /CE equals to “L” level, reading operation of data selected in the address after transition will start.
7 to 10, 13 to 16, 29 to 32, 35 to 38	I/O0 to I/O15	Data Input/Output pins These are 16 bits bidirectional pins for reading and writing.
6	/CE	Chip Enable Input pin In case the /CE equals to “L” level and /ZZ equals to “H” level, device is activated and enables to start memory access. In writing operation, input data from I/O pins are latched at the rising edge of /CE and written to FeRAM memory array.
17	/WE	Write Enable Input pin Writing operation starts at the falling edge of /WE. Input data from I/O pins are latched at the rising edge of /WE and written to FeRAM memory array.
41	/OE	Output Enable Input pin When the /OE is “L” level, valid data are output to data bus. When the /OE is “H” level, all I/O pins become high impedance (High-Z) state.
28	/ZZ	Sleep Mode Input pin When the /ZZ becomes to “L” level, device transits to the Sleep Mode. During reading and writing operation, /ZZ pin shall be hold “H” level.
39, 40	/LB, /UB	Lower/Upper byte Control Input pins In case /LB or /UB equals to “L” level, it enables reading/writing operation of I/O0 to I/O7 or I/O8 to I/O15 respectively. In case /LB and /UB equal to “H” level, all I/O pins become High-Z state.
11, 33	VDD	Supply Voltage pins Connect all two pins to the power supply.
12, 34	VSS	Ground pins Connect all two pins to ground.

Note: Please refer to the timing diagram for functional description of each pin.

▪ Current method of Latch-Up Resistance Test

Note: The voltage V_{IN} is increased gradually and the current I_{IN} of 300 mA at maximum shall flow.
 Confirm the latch up does not occur under $I_{IN} = \pm 300 \text{ mA}$.
 In case the specific requirement is specified for I/O and I_{IN} cannot be 300 mA, the voltage shall be increased to the level that meets the specific requirement.

• C-V method of Latch-Up Resistance Test

Note: Charge voltage alternately switching 1 and 2 approximately 2 sec intervals. This switching process is considered as one cycle.

Repeat this process 5 times. However, if the latch-up condition occurs before completing 5times, this test must be stopped immediately.
