Precision Wide Bandwidth Quad Analog Switches

Features

- Single-Supply Operation (+2V to +6V)
- Rail-to-Rail Analog Signal Range
- Low On-Resistance (6-ohm typ @ 5V) Minimizes Distortion and Error Voltages
- R_{ON} Matching Between Channels, 0.4-ohm typ
- On-Resistance Flatness, 2-ohm typ
- Low Charge Injection. Q=4pC typ. Reduces Step errors, "clicking, popping" noise
- High Speed. t_{ON}, 10ns typ
- Very Low Crosstalk: -72dB @ 30 MHz
- Wide -3dB Bandwidth: >200 MHz
- High-Current Channel Capability: >100mA
- TTL/CMOS Logic Compatible
- Low Power Consumption (0.5µW typ)
- Pin-compatible with DG3XX, DG4XX, MAX39X
- Packaging (Pb-free & Green):
  - 16-pin QSOP (Q)

Description

The 392A is a monolithic analog switches designed for low-voltage, single-supply operation. This high-precision device is ideal for low-distortion audio, video, signal switching and routing applications.

The PI5A392A has four normally open (NO) switches. Each switch conducts current equally well in either direction when on. When off they block voltages up to the power-supply rails.

The 392A is fully specified with +5V, and +3.3V supplies. With +5V, they guarantee <12-ohm on-resistance. On-resistance matching between channels is within 2-ohm. On-resistance flatness is less than 4ohm over the full signal range. The PI5A39X family guarantees fast switching speeds (tON < 20ns).

This product is available in the 16-pin QSOP package for operation over the industrial (-40oC to +85 oC) temperature range.

Applications

- Audio, Video Switching and Routing
- Battery-Powered Communication Systems
- Computer Peripherals
- Telecommunications
- Portable Instrumentation
- Mechanical Relay Replacement

Notes:
1. For conditions shown as Max or Min, use appropriate value specified under Electrical Characteristics for applicable device type.
2. $\Delta R_{ON} = \Delta R_{ON\,max} - R_{ON\,min}$.
3. Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal range.

Applications

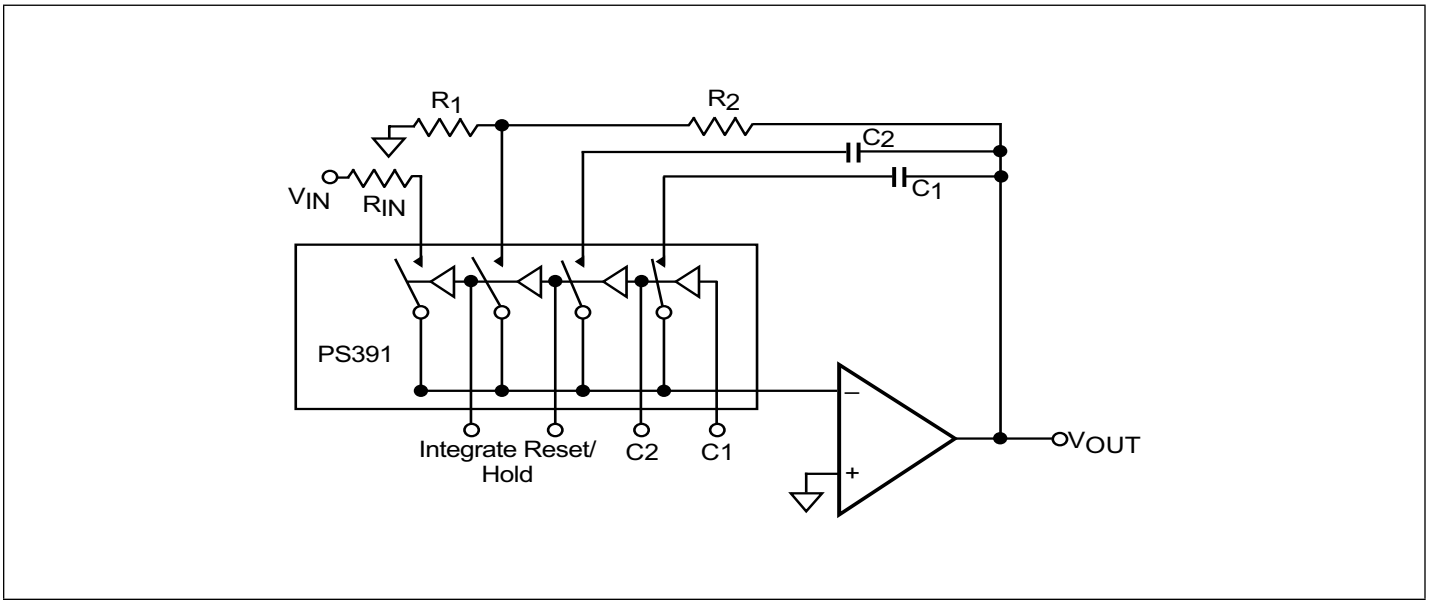

Figure 1. Programmable Integrator and Sample/Hold

The 5A39X can be used to insert various capacitors (C_1, C_2) and set proper RC times for integration. Resistors R_1 and R_2 set initial gain. The R_{IN} resistor X C_1 or C_2 sets the RC time. The reset switch discharges the hold capacitor through R_{IN}.
