

5A 2-4 Cell Buck-Boost Switching Battery Charger

1 General Description

The RT9492 is a highly-integrated 5A Buck-Boost switch mode battery charge management and system power path management device for 2-4 cell Li-Ion and Li-polymer battery. The low impedance power path optimizes switch-mode operation efficiency, reduces battery charging time and extends battery life during discharging phase. The I²C serial interface with charging and system settings makes the device a truly flexible solution.

The recommended junction temperature range is -40°C to 130°C, and the ambient temperature range is -40°C to 85°C.

2 Ordering Information

Note 1.

- Marked with ⁽¹⁾ indicated: Compatible with the current requirements of IPC/JEDEC J-STD-020.
- Marked with ⁽²⁾ indicated: Richtek products are Richtek Green Policy compliant.

3 Applications

- Smart Phone/Tablet/Chrome Book
- Drone
- Portable Device and Accessory

4 Features

- High Efficiency, 750kHz/1MHz/1.5MHz Programmable Frequencies, Synchronous Switch-Mode Buck-Boost Charger
 - 96.7% Charge Efficiency at 2A with 9V Input and 8V Battery
 - Support 3.6V to 24V Input Voltage Range
 - Average Input Current Regulation (AICR)
 - Minimum Input Voltage Regulation (MIVR)
- Support USB On-The-Go (OTG)
 - 93.4% OTG Efficiency at 2A with 8.4V Battery and 5V Output
 - Output Voltage with 10mV Resolution to Support USB-PD
 - BAT Current Limit Regulation (BCLR)
- Support Dual Input Selection
- Support BC1.2, Host Mode and FRS/Seamless
- Support 11-Channel, 16-bit ADC
- Low Battery Quiescent Current
- High Accuracy for Charger CV and ICHG
- Protection
 - Over-Temperature Protection (OTP)
 - Junction Thermal Regulation (JTR)
 - Input Protection (VAC OVP/VBUS OVP/OCP)
 - Battery Overvoltage Protection (VBAT OVP)
 - System Voltage Protection (VSYS OVP/UVP)
 - System Over-Load Protection (VSYS OLP)
 - Cycle-by-Cycle Overcurrent Protection (OCP)
 - OTG Low Battery Protection (OTG LBP)
 - OTG Voltage Protection (OTG OVP/UVP)

5 Simplified Application Circuit

8 Pin Configuration

VQFN-29TL 4x4 (FC)

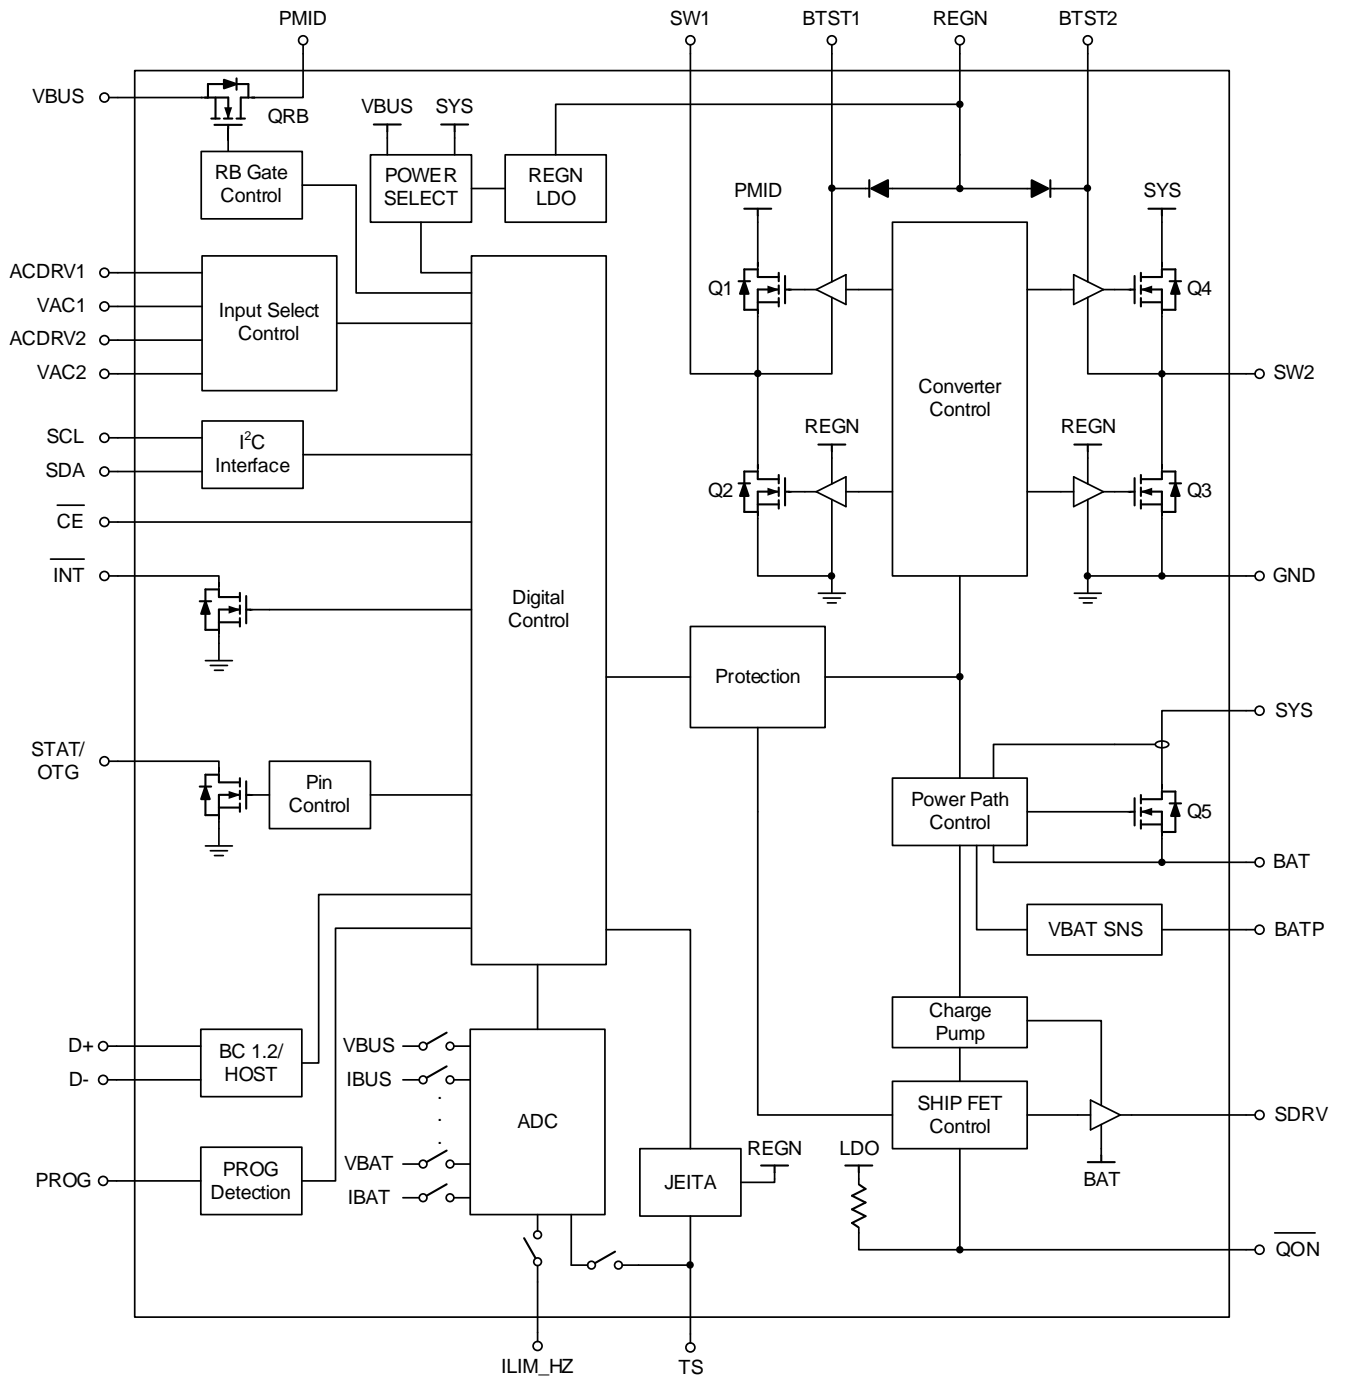

9 Functional Pin Description

Pin No.	Pin Name	I/O	Pin Function
1	STAT/OTG	DIO	Open-drain charger status output. Connect the STAT pin to a logic rail via 2.2kΩ to 10kΩ resistor. The STAT pin indicates charger status. Open-drain OTG mode enable control input. Active high. Connect the OTG pin to a logic rail via 2.2kΩ to 10kΩ resistor.
2, 3	VBUS	P	Charger input voltage. The internal current sensing circuit is connected between VBUS and PMID. Connect two 10μF capacitors from VBUS to GND and place as close as possible to VBUS.
4	BTST1	P	The high-side switching MOSFET (Q1) driver positive supply. Internally, the BTST1 is connected to the cathode of the bootstrap diode. Connect the 47nF bootstrap capacitor from BTST1 to SW1.
5	REGN	P	PWM low-side driver and internal supply output. Internally, REGN is connected to the anode of the bootstrap diode. Connect a 4.7μF capacitor from REGN to GND. The capacitor should be placed close to the IC. REGN must be used only for RT9492 relative functions.
6	D+	AIO	Positive line of the USB data line pair. D+/D– based USB host/charging port detection. The detection includes data contact detection (DCD), primary, secondary detection in BC1.2 and manual control mode.
7	D-	AIO	Negative line of the USB data line pair. D+/D– based USB host/charging port detection. The detection includes data contact detection (DCD), primary, secondary detection in BC1.2 and manual control mode.
8	VAC2	AI	VAC2 voltage sensing. When a voltage on VAC2 is above VAC2_UVLO, it represents input source plug in on port2. When there is no external AC-RBFET2, the VAC2 must connect to VBUS
9	VAC1	AI	VAC1 voltage sensing. When a voltage on VAC1 is above VAC1_UVLO, it represents input source plug in on port1. When there is no external AC-RBFET1, the VAC1 must connect to VBUS

Pin No.	Pin Name	I/O	Pin Function
10	ACDRV2	P	External AC-RB N-channel FET gate driver output. The ACDRV2 is connected to external AC-RBFET2, the charger turns on AC-RBFET2 by increasing ACDRV2 voltage 5V above the AC-RBFET2 drain when the turn on condition is valid. When there is no external AC-RBFET2, the ACDRV2 must connect to GND.
11	ACDRV1	P	External AC-RB N-channel FET gate driver output. The ACDRV1 is connected to external AC-RBFET1, the charger turns on AC-RBFET1 by increasing ACDRV1 voltage 5V above the AC-RBFET1 drain when the turn on condition is valid. When there is no external AC-RBFET1, the ACDRV1 must connect to GND.
12	$\overline{\text{QON}}$	DI	Ship FET control input. When the device is in ship mode, a logic low duration with tQON_EXIT_SHIP_DLY turns on Ship FET to exit ship mode. A logic low duration with tQON_RST turns off the ship FET and stop converter switching for tSYS_RST and resume to provide system reset. Pull-High to internal bias circuit via 200kΩ resistor.
13	$\overline{\text{CE}}$	DI	Charge enable pin. Active low. When this pin is driven low and REG_CHG_EN = 1, battery charging is enabled. Do NOT leave this pin floating.
14	SCL	DI	I ² C interface clock. Connect SCL to the logic rail through a 10kΩ resistor.
15	SDA	DIO	I ² C interface clock. Connect SDA to the logic rail through a 10kΩ resistor.
16	TS	AI	Temperature qualification voltage input to support JEITA profile. Connect a negative temperature coefficient thermistor (103AT). Program temperature window with a resistor divider from REGN to TS to GND. The resistors used for resistor divider recommend 1% resistance tolerance. Charge suspends when TS pin voltage is out of range. When TS pin is not used, connect a 10kΩ resistor from REGN to TS and a 10kΩ resistor from TS to GND.
17	ILIM_HZ	AI	Input current limit setting and HZ mode control. A resistor divider is connected to ILIM_HZ pin by pull up resistors from REGN to GND. The pin voltage is calculated as $V_{ILIM_HZ} = 1V + 800m\Omega \times ILIM$, where ILIM is target input current limit. The input current limit for charger is the lower setting between ILIM_HZ and AICR register. When the pin voltage is below 0.75V, the buck-boost converter stops switching and REGN on. When the pin voltage is higher than 1V, the converter resumes switching.
18	BATP	AI	Positive battery voltage sensing. Connect to the positive terminal of battery pack. It is recommended to place 100Ω series resistor between BATP and the positive terminal of battery pack.
19	BTST2	P	The high-side switching MOSFET (Q4) driver positive supply. Internally, the BTST2 is connected to the cathode of the bootstrap diode. Connect the 47nF bootstrap capacitor from BTST2 to SW2.
20	PROG	AI	Charger POR default setting program. A resistor is connected from PROG to GND to set battery cells for default charging profile and switching frequency. The resistor connected to PROG is recommended to be 1% or 2% resistance tolerance.
21	$\overline{\text{INT}}$	DO	Open-drain interrupt output. Active low. Connect the $\overline{\text{INT}}$ to a logic rail through 10kΩ resistor. The $\overline{\text{INT}}$ pin sends active low pulse to host to report charger device status and fault.
22, 23	BAT	P	Battery connection point to the positive terminal of the battery pack. The internal current sensing circuit is connected between SYS and BAT. Connect two 10μF capacitors from BAT to GND and place as close as possible to BAT.

Pin No.	Pin Name	I/O	Pin Function
24	SDRV	P	External Ship N-channel FET gate driver output. The SDRV is connected to external ship FET, the SDRV is always turned off when in ship or shutdown mode. Without using ship FET, must connect a 1nF/50V capacitor from SDRV to GND.
25	SYS	P	Charger output connection point. Connected to the drain of high-side switching MOSFET (Q4) and the internal current sensing circuit between SYS and BAT. Connect five 10 μ F and a 0.1 μ F capacitors from SYS to GND and place as close as possible to SYS.
26	SW2	P	Switching node two connecting to output inductor. Internally SW2 is connected to the drain of the low-side switching MOSFET (Q3) and the source of the high-side switching MOSFET (Q4).
27	GND	P	Power Ground
28	SW1	P	Switching node one connecting to output inductor. Internally SW1 is connected to the source of the high-side switching MOSFET (Q1) and the drain of the low-side switching MOSFET (Q2).
29	PMID	P	Connected to the drain of high-side switching MOSFET (Q1). Connect three 10 μ F and a 0.1 μ F capacitors from PMID to GND and place as close as possible to PMID.

11 System Block Diagram

12 Absolute Maximum Ratings

(Note 2)

• Voltage Sense Pin Voltage, VAC1, VAC2-----	-2V to 30V
• Supply Pin Voltage, VBUS -----	-2V to 30V
• Terminal Pin Voltage, PMID -----	-0.3V to 30V
• Terminal Pin Voltage, ACDRV1, ACDRV2, BTST1 -----	-0.3V to 32V
• Terminal Pin Voltage, BTST2 -----	-0.3V to 29V
• Terminal Pin Voltage, SW1 -----	-2V (50ns) to 30V
• Terminal Pin Voltage, SW2 -----	-2V (50ns) to 23V
• Terminal Pin Voltage, SYS-----	-0.3V to 23V
• Supply Pin Voltage, BAT -----	-0.3V to 20V
• Voltage Sense Pin Voltage, BATP -----	-0.3V to 20V
• Terminal Pin Voltage, SDRV -----	-0.3V to 26V
• Terminal Pin Voltage, PMID-VBUS -----	-0.3V to 6V
• Terminal Pin Voltage, BTST1-SW1, BTST2-SW2-----	-0.3V to 6V
• Terminal Pin Voltage, SYS-BAT -----	-0.3V to 16V
• Terminal Pin Voltage, SDRV-BAT-----	-0.3V to 6V
• Other Pins Voltage, STAT/OTG, SCL, SDA, $\overline{\text{INT}}$, $\overline{\text{CE}}$, D+, D- -----	-0.3V to 6V
• Other Pins Voltage for REGN, TS, $\overline{\text{QON}}$, ILIM_HZ, PROG -----	-0.3V to 6V
• Power Dissipation, P_D @ $T_A = 25^\circ\text{C}$	
VQFN-29TL 4x4 (FC) -----	2.38W
• Package Thermal Resistance (Note 3)	
VQFN-29TL 4x4 (FC), θ_{JA} -----	44°C/W
VQFN-29TL 4x4 (FC), θ_{JC} -----	3.6°C/W
• Lead Temperature (Soldering, 10 sec.)-----	260°C
• Junction Temperature -----	150°C
• Storage Temperature Range -----	-55°C to 150°C
• ESD Susceptibility (Note 4)	
HBM (Human Body Model) -----	2kV

Note 2. Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Note 3. θ_{JA} is measured under natural convection (still air) at $T_A = 25^\circ\text{C}$ with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard. θ_{JC} is measured at the bottom of the package.

Note 4. Devices are ESD sensitive. Handling precautions are recommended.

13 Recommended Operating Conditions

(Note 5)

- Voltage Sense Pin Voltage, VAC1, VAC2----- 3.6V to 24V
- Supply Input Voltage Range, VBUS ----- 3.6V to 24V
- Maximum Input Current, IBUS ----- 3.3A
- Maximum Input Current, IOTG ----- 3.32A
- Maximum Output Current (SW2), ISYS (Note 6)----- 5A
- Maximum Battery Voltage, VBAT ----- 18.8V
- Maximum Charge Current, IBAT ----- 5A
- Maximum Discharge Current, IBAT----- 10A
- Ambient Temperature Range ----- -40°C to 85°C
- Junction Temperature Range ----- -40°C to 130°C

Note 5. The device is not guaranteed to function outside its operating conditions.

Note 6. Maximum output current for ISYS recommend to set switching frequency on 1MHz.

14 Electrical Characteristics

(VBUS_UVLO < VBUS < VBUS_OVP, T_J = 25°C, unless otherwise specified) (Note 7)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Quiescent Current						
Battery Discharge Current (BATP) in Ship Mode	I _{Q_BAT_OFF}	BATP = 8V, No VBUS, I ² C enabled, SYS no load, in ship mode, measure IBAT	--	2.5	6	μA

Application Information

([Note 9](#))

16.1 Power-On-Reset (POR)

The device powers internal bias circuits from the higher voltage of VAC1/ VAC2, VBUS, VBATP and VBAT. When VAC1/ VAC2 rises above VAC_UVLO, VBUS rises above VBUS_UVLO, VBATP rises above VBATP_UVLO or VBAT rises above VBAT_UVLO, I²C interface is ready for communication and all the registers are reset to default value.

16.1.1 PROG Pin for Cell and Frequency Setting

During POR stage, the device detects the PROG pin pull-down resistance, and then sets register 0x0A[7:6] for BATTERY_CELL and register 0x13[5] for PWM_FREQ. Follow [Table 2](#) for the PROG pin pull-down resistor selection. The pull-down resistor on the PROG pin is recommended to have ±1% to 2% tolerance for its resistance.

16.1.2 BATTERY_CELL for Default Charging Parameter

After the PROG pin detected, the BATTERY_CELL will set by PROG pull-down resistance, and then the following registers in [Table 3](#) will be set by BATTERY_CELL for default charging parameters.

Table 2. The PROG Pin Resistance for Cell and Frequency Setting

Cell	Resistance for Typical Value	Frequency	BATTERY_CELL	PWM_FREQ
2s	6.04kΩ	1.5MHz	01	0
	8.2kΩ	750kHz		1
3s	10.5kΩ	1.5MHz	10	0
	13.7kΩ	750kHz		1
4s	17.4kΩ	1.5MHz	11	0
	27.0kΩ	750kHz		1

Table 3. Default Register Setting for Charging Parameter by BATTERY_CELL

BATTERY_CELL (REG0x0A[7:6])	2s	3s	4s
VSYSMIN (REG 0x00[5:0])	7V	9V	12V
VBAT_REG (REG 0x01[10:0])	8.4V	12.6V	16.8V
VBAT_REG range	5V to 9.99V	10V to 13.99V	14V to 18.8V
ICHG_CTRL (REG 0x03[8:0])	2A	1A	1A

After POR, the charging parameters shown in Table 3 can be programmed by I²C; however, the VBAT_REG has programming range regarding BATTERY_CELL setting, so the host needs to ensure the program value within the right range. If the host programs the value out of the range, the charger will ignore and keeps at the original value. The charging parameters in Table 3 can be changed by programming BATTERY_CELL. When the host needs to program any parameter in REG0x0A, the host must program REG0x0A at first, then the host can program other registers.

16.1.3 Device Power Up from Battery Only

When only Battery is present and VBATP above VBATP_UVLO, the SHIPFET turns on to connect VBATP to VBAT. Then, when VBAT above VBAT_UVLO, the BATFET turns on to connect VBAT to VSYS. The REGN stays off to minimize the quiescent current. The low quiescent current on VBAT and low RDS(ON) of BATFET minimizes device power consumption and conduction loss, which maximize battery run life.

The device always monitors the discharge current through BATFET (Battery Supply Mode). When the system is shorted or overloaded (IBAT > IBAT_OCP), if SHIP_FET_PRESENT = 1 (0x14, bit[7]) and EN_BATOC = 1 (0x14, bit[0]), the device turns off SHIPFET and BATFET immediately to enter Shipping Mode until VBUS is plugged in again or uses the methods to Exit Shipping Mode to re-enable BATFET.

16.2 Dual-Input Power Selection

The charger has two ACDRV drivers to control optional back-to-back N-channel MOSFET for input power source selection. During POR, ACDRV pin detects whether optional AC-RBFET is present or not, then updates status to ACRB1_STAT and ACRB2_STAT. [Table 4](#) shows the detailed status.

Table 4. Optional AC-RBFET Status for Input Power Selection

Scenario	AC-RBFET 1 present	AC-RBFET 2 present	ACDRV1 pin	ACDRV2 pin	ACRB1_STAT	ACRB2_STAT
Single Input	N	N	GND	GND	0	0
One AC-RBFET	Y	N	Gate	GND	1	0
	N	Y	GND	Gate	0	1
Dual Input	Y	Y	Gate	Gate	1	1

16.2.1 Single Input

In this scenario, input power source comes only from VBUS, both of VAC1 and VAC2 connect to VBUS. After POR, control register EN_ACDRV1 and EN_ACDRV2 keep at 0.

16.2.2 One AC-RBFET

In this scenario, only AC-RBFET1 or AC-RBFET2 is present; for example, only AC-RBFET1 is present, the ACDRV1 connects to AC-RBFET1 gate, and the ACDRV2 pulls down to GND. VAC2 connects to VBUS. After POR, register EN_ACDRV2 keeps at 0.

1. When VAC1 > VAC_UVLO, the charger forces register EN_ACDRV1 = 1 to turn on AC-RBFET1.
2. To swap input source from VAC1 to another power source, at first, the host has to set register DIS_ACDRV_EN = 1 to force EN_ACDRV1 = 0 to turn off AC-RBFET1; after VBUS < VBUS_UVLO, the host enables another power source to directly connect to VBUS for input power source.

16.2.3 Dual Input

In this scenario, both of AC-RBFET1 and AC-RBFET2 are present.

1. VAC1 is plugged in, when $VAC1 > VAC_{UVLO}$, the charger sets register $EN_ACDRV1 = 1$ to turn on AC-RBFET1.
 2. Then VAC2 is plugged in, when $VAC2 > VAC_{UVLO}$, the charger still sets register $EN_ACDRV1 = 1$.
 3. To swap input power source from VAC1 to VAC2, the host has to set $EN_ACDRV1 = 0$ and $EN_ACDRV2 = 1$ at the same time, after register is programmed, charger turns off AC-RBFET1.
 4. After $VBUS < VBUS_{UVLO}$, the charger automatically turns on AC-RBFET2 to swap input power source from VAC1 to VAC2.
 5. When VAC2 is plugged out, after $VAC2 < VAC_{UVLO}$, then charger sets $EN_ACDRV2 = 0$ to turn off AC-RBFET2.
 6. After $VBUS < VBUS_{UVLO}$, charger automatically sets EN_ACDRV1 from 0 to 1 to turn on AC-RBFET1.
 7. When VAC1 is plugged out, after $VAC1 < VAC_{UVLO}$, the charger sets $EN_ACDRV1 = 0$ to turn off AC-RBFET1.
- If both of $VAC1 > VAC_{UVLO}$ and $VAC2 > VAC_{UVLO}$, and the host sets $EN_ACDRV1 = 1$ and $EN_ACDRV2 = 1$, the charger will ignore and keep original register setting. The charger does not allow to turn on AC-RBFET1 and AC-RBFET2 at the same time.

16.3 Device Power Up from Input Power Source

When input power is present on VBUS, after VBUS is above $VBUS_{UVLO}$, the power up sequence is as listed:

1. Power up REGN LDO.
2. Poor Source Detection
3. $VBUS_STAT$ detection is based on input source type to set default AICR register.
4. The device detects voltage on $ILIM_HZ$ pin to set ILIM, the final input current limit is based on the minimum value between AICR and ILIM.
5. The device detects voltage on VBUS to set default MIVR register.
6. Buck-boost converter power-up.

16.4 Power-Up REGN LDO

The REGN LDO supplies for internal bias circuit and the buck-boost power MOSFET gate driver. The REGN also provides bias to TS and $ILIM_HZ$ external resistor and pull-up rail of STAT and PG. The REGN is enabled when the below conditions are valid:

1. VBUS is above $VBUS_{UVLO}$
2. The charger is in OTG mode.
3. ADC TS channel is on ($ADC_EN = 1$ and $TS_ADC_DIS = 0$)
4. DPDM manual mode is on (DP_CTRL or DM_CTRL is on)

The REGN is disabled when the below conditions are valid:

1. Only VBAT with ADC TS channel is off, DPDM manual mode is off and not in OTG mode.
2. The device in HZ mode and BC1.2 is disabled.

16.5 Poor Source Detection

After REGN powers up, the device checks the current capability of the input source. The input source has to meet the following requirements to turn on the buck converter.

1. VBUS below $VBUS_{OVP_RISE}$.

2. VBUS above VBUS_BAD_ADP then pulling

IBUS_BAD_ADP (typical = 1kΩ).

When input source passes above conditions, the VBUS_GD_RDY_STAT and the VBUS_GD_RDY_FLAG turn to high and INT pin is pulsed for interrupting the host. If VBUS_GD_RDY_STAT does not turn to high, it repeats poor source detection every 2 seconds. After 8 times failures, the device sets register EN_HZ = 1 and goes to HZ mode. The register EN_HZ can be cleared to 0 by adapter re-plug in or the host sets the EN_HZ = 0. When VBUS triggers poor source detection failure, the BAD_ADAPTER_FLAG turns to high and INT pin is pulsed for interrupting the host.

16.6 VBUS Source Type Detection

After VBUS_GD_RDY_STAT turns to high, the device runs VBUS source type detection. After detection is completed, the BC12_DONE_STAT and BC12_DONE_FLAG turn to high and INT pin is pulsed for interrupting the host. When VBUS source type detection is completed, the following registers are changed:

1. VBUS_STAT is updated to indicate VBUS source type.
2. AICR register is changed to the result of VBUS_STAT automatically if AUTO_AICR = 1, AICR setting result is listed in [Table 5](#).

Table 5. AICR Setting from D+/D- Detection

Detection	AICR Setting	VBUS_STAT
USB SDP	0.5A	0001
USB CDP	1.5A	0010
USB DCP	3.25A	0011
NSDP	3.25A	0101
Special Adapter	1A/2A/2.1A/2.4A	0110

The device supports standard USB BC1.2 and special adapter, detection result is listed in [Table 6](#).

Table 6. AICR Setting from Special Adapter

D+/D- Voltage Threshold	AICR Setting
0.9V < D+ < 1.5V	2A
1.5V < D+ < 2.3V 2.3V < D-	1A
D+ > 2.3V D- < 2.3V	2.1A
D+ > 2.3V D- > 2.3V	2.4A

16.7 Average Input Current Regulation (AICR)

The range of AICR is from 100mA to 3.3A with 10mA resolution. When register AUTO_AICR is set to 1, the device changes AICR automatically after VBUS source type detection, refer to [Table 5](#) and [Table 6](#) for detailed information. After charger automatically sets AICR, register AICR is programmable by the host.

16.8 ILIM_HZ Detection

After Poor source detection, the charger starts to detect voltage on the ILIM_HZ pin, and calculate the ILIM by the equation: $V_{ILIM_HZ} = 1V + 800m\Omega \times ILIM$. When register ILIM_HZ_EN is set to 1, the charger input current limit is set by the minimum value between AICR and ILIM. If the ILIM calculation result is less than 100mA, the charger clamps ILIM at 100mA.

When the ILIM_HZ pin is pulled lower than 0.75V, the charger stops switching and REGN stays on either in charger or OTG mode. The charger resume switching when the ILIM_HZ pin voltage rises higher than 1V.

16.9 Minimum Input Voltage Regulation (MIVR)

The MIVR function prevents input voltage from dropping due to insufficient current provided from input power source. The VBUS voltage decreases to VMIVR setting level when the overcurrent condition of input power source occurs. The register VMIVR default setting is 3.6V; It can be programmed by the host, with the range from 3.6V to 22V with 0.1V resolution. If the register AUTO_MIVR is set to 1, after poor source detection, the charger starts to detect voltage on VBUS before the charger starts switching, the register VMIVR will be set to VBUS-0.7V when VBUS < 7V, or set to VBUS-1.4V when VBUS \geq 7V.

During charge process, if the input voltage is changed, when the register FORCE_MIVR_DET is set to 1 by the host, the charger stops switching and detect voltage on VBUS; according to above calculation equation, the register VMIVR updates to the new value, and the charger resumes switching.

When DIS_EOC_FCCM = 0 to enable FCCM to increase EOC accuracy, the MIVR setting level must set \sim 25% voltage difference from VBAT_REG to avoid converter from working in Buck-Boost operation mode when VBUS plug out.

16.10 Converter Power-Up

After the Input and MIVR is set, the converter is enabled and starts switching. BATFET stays on unless charger is disabled (CHG_EN = 0 or EN_PIN is pulled high).

The device integrates a synchronous PWM controller with high-accuracy current and voltage regulation, and the switching frequency is programmed with 750kHz/ 1.5MHz by the register PWM_FREQ or PROG pin. The device supports PFM control to improve light-load efficiency, also supports OOA (Out-of-Audio) control by the register DIS_CHG_OOA to prevent converter from switching in audio frequency.

16.11 OTG Mode Operation

The RT9490 also supports OTG (On-The-Go) mode and enters OTG mode via register EN_OTG. The maximum output current is up to 3.32A. In OTG mode, the VBUS_STAT register bits is updated to 0111, the VBUS output voltage is 5V and output limit current is 3A by default, output voltage (VOTG), output current limit (IOTG) and input current limit (IBAT_REG) can be programmed by the host. The OTG mode operation can be enabled by following condition:

1. VBAT is above VOTG_LBP rising threshold.
2. EN_OTG is set to high.
3. Voltage at TS pin is within acceptable range ($V_{VTS_HOT_OTG} < V_{TS} < V_{VTS_COLD_OTG}$).

When above conditions are passed, refer to [Table 4](#) for AC_RBFET configuration for below setting.

16.11.1 Single Input

In this scenario, there is no any AC-RBFETs, the converter starts up with 4ms delay after register EN_OTG is set to 1, then VBUS voltage rises to the VOTG setting.

16.11.2 One AC-RBFET

In this scenario, only AC-RBFET1 or AC-RBFET2 is present; for example, if only AC-RBFET1 is present, when register EN_OTG is set to 1.

1. The converter starts up with 4ms delay after register EN_ACDRV1 is set to 1, then VAC1 voltage rises to the VOTG setting.
2. If register DIS_ACDRV_EN is set to 1, the converter starts up with 4ms delay, then VBUS voltage rises to the VOTG setting.

16.11.3 Dual Input

In this scenario, both of AC-RBFET1 and AC-RBFET2 are present, when register EN_OTG is set to 1.

1. The converter starts up with 4ms delay after register EN_ACDRV1 is set to 1, then VAC1 voltage rises to the VOTG setting.
2. To swap OTG output from VAC1 to VAC2, register EN_ACDRV1 is set to 0 and EN_ACDRV2 is set to 1, the device pulls low ACDRV1 pin to turn off AC-RBFET1, and pulls up ACDRV2 pin to turn on AC-RBFET2, and then VAC2 voltage rises to VOTG setting.
3. If register DIS_ACDRV_EN is set to 1, the device forces EN_ACDRV1 and EN_ACDRV2 at 0, the converter starts up with 4ms delay, then VBUS voltage rises to VOTG setting.

In OTG mode, if the host sets EN_ACDRV1 = 1 and EN_ACDRV2 = 1, the device will ignore and keep original register setting. The charger does not allow to turn on AC-RBFET1 and AC-RBFET2 at the same time.

In OTG mode, the device supports PFM control to improve light-load efficiency, also supports OOA (Out-of-Audio) control by the register DIS_OTG_OOA to prevent converter from switching in the audio frequency.

In OTG mode, the device monitors discharge current from battery. When battery discharge current is higher than register IBAT_REG setting, the device start to decrease OTG output current to keeps the systems power at the first, if the system power still increases, when OTG output voltage falls below OTG_UVP, the converter will turn off to maintain system power.

16.12 IBAT Regulation During OTG Mode

The range of IBAT_REG is from 3A to 5A with 1A resolution. In OTG mode, when the discharge current from battery is over IBAT_REG setting, the converter starts to decrease output voltage to regulate output power from battery. The device also supports IBAT_REG disable after converter starts switching in OTG mode. When IBAT_REG is set at 11 to disable IBAT_REG before converter starts switching in OTG mode, the IBAT_REG will be set to default setting.

16.13 Power Path Management

The device provides automatic power path selection to supply system (VSYS) from VBUS, VBAT (battery) or both of them.

16.13.1 SHIPFET Control

The device supports SDRV driver for optional SHIPFET. With optional SHIPFET, after POR, the register SHIP_FET_PRESENT must set to 1 by the host, and the SHIPFET is controlled by the register SDRV_CTRL.

16.13.2 IDLE

When BATH is higher than VBAT_UVLO rising threshold, the SDRV pin turns on SHIPFET and the device powers on for default register setting.

16.13.3 Shutdown Mode

To extend battery life when shipping or storage, the device supports extremely minimum battery leakage current with shutdown mode. When device enters Shutdown Mode, the device turns off SHIPFET, internal BATFET and circuit. The only way for device to exit shutdown mode to restore power for system is by plug-in VBUS, and all registers return to default setting when the device exits shutdown mode. When in battery only condition, the device can enter shutdown mode.

16.13.4 Ship Mode

When device enters ship mode, the device turns off SHIPFET and internal BATFET. The device can exit Ship Mode to restore power for system by the following method:

1. VBUS plug in
2. Set SDRV_CTRL to IDLE
3. Set RST_ALL or REG_RST bit to reset all registers to default
4. Press QON pin from high to low.

When in battery only condition, the device can enter Ship Mode.

16.13.5 System Power Reset

The device supports system reset via SDRV_CTRL by the host. When entering System Power Reset, the device turns off SHIPFET and BATFET; after 600ms, the device restores power for system and SDRV_CTRL goes back to IDLE. The device can enter System Power Reset even with VBUS plug in.

The host can set SDRV_DLY = 0 to turn off SHIPFET and BATFET immediately or set SDRV_DLY = 1 to delay 10s to turn off SHIPFET and BATFET.

16.13.6 The QON Pin Operation

The QON pin has two functions to control SHIPFET and BATFET. The register SHIP_FET_PRESENT must set to 1 by the host to enable QON function.

- Exit Ship Mode

Press QON pin from high to low with deglitch time by the register QON_EXIT_SHIP_DLY setting time, the device turns on SHIPFET and BATFET to restore power for system.

- SYSTEM Reset

With register QON_RST_EN is set to 1, press QON pin from high to low with deglitch time 10s, the device turns off SHIPFET and BATFET, after 600ms, the device turns on SHIPFET and BATFET to restore power for system.

16.14 Battery Charging Management

The device has charge current up to 5A with 9mΩ BATFET to improve charge efficiency and decrease voltage drop during battery discharging.

16.14.1 Charging Cycle

When battery charging is enabled (CE pin set to low and EN_CHG = 1), the device autonomously completes a charging cycle without host controls. The device default parameters are shown in [Table 3](#). The host can also change charging parameters through I²C.

A charging cycle starts with the following condition:

1. Buck-Boost converter starts.

2. Battery charging is enabled (CE pin is low, EN_CHG = 1)
3. Without any thermal fault on TS
4. No safety timer fault

The charger is in “end of charge status” when the charging current is below EOC current threshold, battery voltage is above recharge voltage threshold, and device not in AICR, MIVR, JEITA, CYC_OCP or thermal regulation.

When battery voltage is discharged below recharge threshold (threshold setting through VRECHG register bits), the device restarts a new charging cycle automatically. After the charge is done, toggle CE pin or CHG_EN can restart a new charging cycle.

16.14.2 Battery Charging Profile

The device charges the battery in five status: trickle charge, pre-charge, constant current, constant voltage and back-ground charge (optional).

Table 7. Charging Current Setting

Current Parameter	Default Current Setting	CHG_STAT
ITRICKLE_CHG	100mA	001
IPRE_CHG	120mA	010
ICHG_REG	2A (2s)/1A (3s, 4s)	011 (CC Mode)/100 (CV Mode)
IEOC_CHG	200mA	111

Figure 1. Charging Profile

16.14.3 End of Charge (EOC)

The charger enters end of charge status when battery voltage is above recharge threshold, and the charge current is below IEOC_CHG. IEOC_CHG setting range is from 120mA to 1000mA with 40mA resolution. After EOC, the BATFET turns off with register EN_TE = 1 and BG_CHG_TMR = 00, and the buck boost converter keeps switching to supply power to the system. BATFET will turn on again when battery voltage is under recharge voltage threshold or device

is in Battery Supply Mode during EOC.

When EOC occurs, there are four conditions as shown in [Table 8](#):

Table 8. EOC Status Scenario

	TE = 1 BG_CHG_TMR (disable)	TE = 1 BG_CHG_TMR (counting)	TE = 1 BG_CHG_TMR (timeout)	TE = 0 BG_CHG_TMR (disable)
STAT Pin	High	High	High	Low
CHG_STAT	111	110	111	101
BATFET	OFF	ON	OFF	ON

1. If the device triggers AICR, MIVR, JEITA, CYC_OCP or thermal regulation status during charging, the actual charging current will be less than the programmed value. In this condition, EOC function will be disabled, and the safety timer's counter clock rate will be half.
2. The back-ground charge can be applied after EOC is detected. The back-ground charge is enabled by setting register BG_CHG_TMR and EN_TE = 1 only. When back-ground charge occurs, the CHG_STAT is set to 110, and the BATFET will turn off after back-ground charge timer expires.
3. The BG_CHG_TMR gets reset at one of the following conditions:
 - EN_CHG disable to enable
 - EOC status re-trigger
 - EOC_RST bit is set
 - REG_RST bit is set
 - RST_ALL bit is set

An INT pulse is asserted to host when entering back-ground charge and back-ground charge timer expires.
4. When DIS_EOC_FCCM = 1, the IEOC accuracy will lower than Electrical Characteristic table. The device use DIS_EOC_FCCM = 0 to increase accuracy, please refer to MIVR function for application notice.

16.14.4 Optimized VDS on BATFET

The device deploys power path function with BATFET separating system from battery. The minimum system voltage is set by register VSYSMIN. The default VSYSMIN setting is controlled by PROG pin.

When the battery voltage is under VSYSMIN setting, the BATFET operates in saturation mode as LDO and the system voltage is typically 200mV above the VSYSMIN setting. When the battery voltage rises above VSYSMIN, BATFET turns fully on to minimize

R_{DS(ON)} for optimizing VDS (voltage different between VSYS and VBAT) on BATFET.

Figure 2. VSYS vs. VBAT for 2s Battery

When BATFET turns off and battery voltage is above VSYSMIN, the system is regulated at typically 300mV above battery voltage. The status register VSYSMIN_STAT = 1 when the system is in minimum system voltage regulation.

16.14.5 DIS_LDO Mode

When the battery voltage is under VSYSMIN setting, the BATFET operates in saturation mode as LDO, and the maximum charge current will be limited under 2A. The device supports disabling LDO mode via register DIS_LDO set to 1 by the host. When DIS_LDO = 1, the BATFET turns fully on even when battery voltage is under VSYSMIN setting, and the VSYS will not regulate on VSYSMIN setting. In DIS_LDO mode, the charge current follows the ICHG_CTRL/IPRE_CHG setting. The DIS_LDO mode only operates when battery voltage is above VTIRCKLE_CHG_RISE.

16.15 Power Management System

To apply maximum current and avoid over loading from the power source on VBUS, the device’s Power Management System continuously monitors the power source voltage and current. When power source is overloaded, either the current exceeds the AICR or the voltage drops to MIVR, the device will reduce the charge current to priority power energy for system.

When the charge current is reduced to zero, but power source still triggers AICR or MIVR, the VSYS starts to drop. Once the VSYS drops under VBAT, the device automatically changes to battery supply mode, and the BATFET turns fully on and battery starts to discharge so that the system is supported from both battery and power source.

Figure 3. Power Management System

16.15.1 Battery Supply Mode

During charge status, when voltage difference between VBAT and VSYS is above 50mV, the BATFET turns on and the BATFET gate regulates the gate driver of BATFET to minimize VBAT-VSYS voltage to stay at 25mV to prevent entering and exiting the battery supply mode frequently. When the voltage of VBAT-VSYS is below 0mV, the charger exits the battery supply mode, and starts to charge battery.

16.15.2 JEITA Protection During Charge Mode

The device provides a single thermistor input for temperature monitor.

To achieve battery thermal protection, JEITA guidelines were released in 2007.

To start a charge cycle, the voltage on TS pin must be in the T1 to T4 range. The device will stop charging if the battery temperature is lower than T1 (Cold) or higher than T4 (Hot).

In this case, the JEITA_COLD_STAT = 1 or JEITA_HOT_STAT = 1 and an INT is asserted to the host.

In cool temperature range (T1 to T2), the charge current is reduced to 50% or 25% of ICHG_REG (configured by JEITA_ISET_COOL).

In warm temperature range (T3 to T4), the voltage setting of VBAT_REG is reduced or the same as VBAT_REG (configured by JEITA_VSET_WARM).

The device provides more flexible settings than JEITA requirement.

In cool temperature range (T1 to T2), the charger can set voltage of VBAT_REG (configured by JEITA_VSET_COOL).

In warm temperature range (T3 to T4), the charge current can be reduced to 50% or 25% of ICHG_REG (configured by JEITA_ISET_WARM).

The device supports temperature threshold setting for COOL (T2) and WARM (T3) by register TS_COOL and TS_WARM.

Figure 4. JEITA Protection for Charging Current and Voltage

There are four sections implemented for JEITA protection. Based on R_{HOT} and R_{COLD}, R_{TS1} and R_{TS2} can be calculated with equation (1) and (2). Herein, R_{HOT} is the NTC resistance of battery over-temperature threshold, and R_{COLD} is the NTC resistance of battery under-temperature threshold.

$$R_{TS1} = V_{REGN} \times [(1/V_{T1} - 1/V_{T4}) / (1/R_{COLD} - 1/R_{HOT})] \dots \dots \dots (1)$$

$$R_{TS2} = R_{TS1} \times [1 / (V_{REGN} / V_{T1} - R_{TS1} / R_{COLD} - 1)] \dots \dots \dots (2)$$

16.15.3 Thermal Protection During OTG Mode

To start a OTG mode to discharge from battery, the voltage on TS pin must be in T0 to T4 range. The device will stop converter if the battery temperature is lower than T0 (OTG_COLD) or higher than T4 (OTG_HOT). In this case, the JEITA_COLD_STAT = 1 or JEITA_HOT_STAT = 1 and an INT is asserted to the host.

Once temperature returns to normal range, the OTG mode is recovered.

Figure 5. Thermal Protect during OTG Mode

The device supports temperature threshold setting for COLD (T0) and HOT (T4) by register OTG_COLD and OTG_HOT.

16.16 Charging Safety Timer

The device has safety timer to prevent abnormal charging time due to poor battery condition. The device can be set EN_TRICHG_TMR, EN_PRECHG_TMR and EN_FASTCHG_TMR for each charging stage. When the safety timer expires, the device stops charging, the TRICHG_TMR_STAT, PRECHG_TMR_STAT, or FASTCHG_TMR_STAT = 1, and an INT is asserted to the host. The safety timer can be disabled by the host.

Table 9. Charging Safety Timer

VBAT	Safety Timer
< VTRICKLE_CHG	1 hour
< VPRE_CHG	0.5 hours, 2 hours (Default)
> VPRE_CHG	5 hours, 8 hours, 12 hours (Default), 24 hours

When the charger in AICR, MIVR, JEITA cool, JEITA warm, thermal regulation or CYC_OCP, the safety timer's counter clock rate will be half.

For example, if charger in AICR status, and timer setting is 12 hours, the actual safety timer will expire in 24 hours. The extended charge timer setting can be disabled by setting TMR2X_EN = 0.

The safety timer will be reset by:

1. Toggle the \overline{CE} pin
2. CHG_EN disable/enable
3. Safety timer disable/enable
4. REG_RST or RST_ALL is set.
5. System Power Reset

16.17 Adaptive Input Current Control

The AICC function provides an adaptive AICR setting to prevent input voltage drops. When the input power source is overcurrent and the VBUS drops to the MIVR level, set EN_AICC bit to 1, the device will automatically decrease AICR level step by step until exit MIVR event. Once AICC is finished, EN_AICC bit keeps at 1 and the adaptive AICR setting is updated to register IAICC, AICC_STAT = 10 and an INT is asserted to the host to indicate AICC_FLAG.

Figure 6. AICC Enable

The device supports re-enable AICC function by setting FORCE_AICC = 1, after AICC done, the FORCE_AICC goes back to 0. FORCE_AICC can be set to 1 after EN_AICC enable. The AICC function only is enabled when EN_AICC = 1.

16.18 MediaTek Pump Express+ (MTK, PE+)

The device can provide an input current pulse to communicate with an MTK-PE+ high voltage adapter. When PE_EN bit is enabled, the device can increase or decrease adapter output voltage by setting PE10_INC or PE20_CODE to the desired value. After enabling PE function, the device will generate a VBUS current pattern for the MTK-PE+ adapter to automatically identify whether to increase or decrease output voltage. Once the PE pattern is finished,

PE_EN bit will clear to 0, and an INT is asserted to the host to indicate PE_DONE_FLAG.

16.19 Watchdog Timer (WDT)

When the device is controlled by host, most of the registers can be programmed by host. The host has to write WD_RST = 1 to reset counter before watchdog timeout and it can disable WDT function by setting WATCHDOG bits to 00, SDRV_CTRL bits to 01 or 10.

When the watchdog timer expires, WDT_STAT and WDT_FLAG turn to high, the $\overline{\text{INT}}$ pin is pulsed for interrupting the host, and the related registers are reset to default values. (Refer to Register Description for details). If the device is in watchdog timeout status, host can write any registers or WD_RST = 1 to return counting.

Figure 7. WDT Flow Chart

16.20 Status Outputs and the OTG Pin Control

16.20.1 Charging Status Indicator (The STAT/OTG Pin)

The device supports multi-function on the STAT/OTG pin. When register DIS_STAT = 0, the STAT/OTG pin configure as a STAT pin.

The device indicates CHG_STAT and any charge fault on the STAT pin. The STAT pin is an open drain that can be used to drive LED. The STAT pin function can be disable by setting the DIS_STAT = 1.

Table 10. STAT Pin State

CHG_STAT	STAT Indicator
Trickle, Pre, Fast charge, IEOC (EOC and TE = 0)	Low
Charge done, Back-Ground charge	High
Not charging (Without any charge fault)	High
Not charging (VBAT_OVP/VSYS_OVP/VBUS_OVP/OTP/Safety timer timeout)	Blinking at 1Hz

16.20.2 Interrupt to Host ($\overline{\text{INT}}$ Pin)

The device reports IRQ to host by the $\overline{\text{INT}}$ pin, which is an open drain output.

The $\overline{\text{INT}}$ pin generates a pulse low with 256 μs when IRQ event occurs.

When an IRQ occurs, the device pulses an $\overline{\text{INT}}$ to the host and keeps IRQ event in register 0x28 to 0x2D and 0x4D until the host reads the IRQ registers. Before the host reads IRQ registers to clean IRQ events, the device will not send any $\overline{\text{INT}}$ pulse again unless any new event occurs.

The IRQ events in register 0x28 to 0x2D are unmasked by default, and in register 0x4D is masked by default.

16.21 Fast Role Swap (FRS)

The device supports multi-function on STAT/OTG pin. When register DIS_STAT = 1 and OTG_PIN_EN = 1, the STAT/OTG pin is configured as an OTG pin.

The device supports Fast Role Swap (FRS) by the following registers setting and steps:

1. Set DIS_STAT = 1 and OTG_PIN_EN = 1
2. The device starts charging, the CHG_STAT is not in the Not charging status.
3. Set EN_OTG = 1 and OTG_EN_CONTROL = 1

When adapter plugs out, after VBUS drops lower than VMIVR setting, and OTG pin is pulled up to high, the device translates from charge mode to OTG mode. Refer to OTG Mode Operation for detailed OTG setting.

16.22 Seamless

The device supports Seamless to automatically translate device from charge mode to OTG mode to keep VBUS voltage output after adapter plugs out.

The device starts Seamless by the following registers setting and steps:

1. The device starts charging, the CHG_STAT is not in the Not charging status
2. Set SEAMLESS_CONTROL not at 00

When adapter plugs out, after VBUS drops lower than VMIVR setting, the device automatically translates from charge mode to OTG mode to keep VBUS voltage on

VOTG setting. The register EN_OTG auto set to 1 and SEAMLESS_CONTROL set to 00 by device. Refer to OTG Mode Operation for detailed OTG setting.

16.23 ADC Conversion Operation

The device supports 16-bit resolution and 11 channels ADC for device information monitoring. The ADC operation is set when ADC_EN = 1, and set ADC_CONV_CTRL for One shot mode or Continuous mode.

After power-on reset (POR), when ADC_EN = 1, the ADC results are updated to the register for each channel after ADC conversion. In One-shot mode, an INT pulse is asserted to the host to indicate ADC_DONE.

The IBAT_ADC and IBUS_ADC support charging current sensing in charge mode, and discharging current sensing in OTG mode, which report with 2's complement for ADC result. With only battery, the device only provides IBAT_ADC for discharging current sensing, in this case, the register IBAT_PIN_EN also must be set to 1, and the IBAT_ADC will report 2's complement result for ADC result.

When TS_ADC, DP_ADC and DM_ADC is enabled, the register EN_HZ must be set to 0. During ADC conversion, the REGN turns on even if the device is only with battery, and RENG keeps on when ADC operates in Continuous mode.

16.24 DP/DM Output Control Manual Mode

The device supports DP/DM output control manual mode by programmed DP_CTRL/DM_CTRL. When DP_CTRL/DM_CTRL is not set at 000, the EN_HZ also must be set to 0, after REGN turns on, the manual control output voltage will be provided on DP/DM.

When adapter plugs in, the device will ignore manual control setting during BC1.2 detection. When BC1.2 is done, an INT is asserted to the host to indicate BC1.2_DONE and DPDM_DONE, and then the manual control will be enabled.

16.25 DP/DM HOST Mode

The device supports HOST mode to configure the DP/ DM as a SDP/CDP/DCP port compatible to standard BC1.2 by programmed HOST_MODE.

16.26 Protections

16.26.1 VBUS Overvoltage Protection in Charge Mode

If VBUS voltage is over VBUS_OVP rising threshold, the device stops switching immediately and an INT pulse is asserted to the host. When VBUS overvoltage, the status VBUS_OVP_STAT = 1 and the CHG_STAT = 000 for stop charging. The device resumes to normal operation when VBUS voltage drops below the VBUS_OVP falling threshold.

16.26.2 VBUS Overvoltage Protection in OTG Mode

If VBUS voltage is over VOTG_OVP rising threshold, the device stops switching immediately and an INT pulse is asserted to the host. When VBUS is overvoltage, the status OTG_OVP_STAT = 1. The device resumes to normal operation when VBUS voltage drops below the VOTG_OVP falling threshold.

16.26.3 VAC Overvoltage Protection

If VAC voltage is over VAC_OVP setting (programmable by VAC_OVP bits), the device sets EN_ACDRV = 0 to turn off external ACRBFET, and an INT pulse is asserted to the host. For example, if VAC1 voltage over VAC_OVP setting, the EN_ACDRV1 is set to 0, the status VAC1_OVP_STAT = 1. The device resumes to normal operation when VAC1 voltage drops below the VAC_OVP falling threshold.

16.26.4 IBUS Overcurrent Protection in Charge Mode

The device monitors currents between VBUS and PMID to provide overload protection. If the IBUS current is over IBUS_OCP threshold, the device will set EN_HZ = 1 to stop switching immediately, also set DIS_ACDRV_EN = 1 to turn off external ACRBFETs and an INT pulse is asserted to the host. The IBUS overload protection can be disabled by setting EN_IBUS_OCP to 0.

16.26.5 OTG Undervoltage Protection

The device monitors OTG output voltage and current to provide VBUS short circuit protection. If VBUS voltage is under VOTG_UVP threshold, the device stops switching. If short circuit is detected on VBUS, the OTG will hiccup 7 times. If converter retries are not successful, EN_OTG bit will set to 0 to disable OTG mode an INT pulse is asserted to the host to indicate OTG_UVP. The hiccup can be disabled by DIS_VOTG_UVP_HICCUP to 1; when hiccup is disabled, the converter continues switching even if VBUS voltage is under VOTG_UVP threshold.

16.26.6 VSYS Overvoltage Protection

If VSYS voltage is over VSYS_OVP rising threshold, the device stops switching immediately and an INT pulse is asserted to the host. When VSYS is overvoltage, the status VSYS_OVP_STAT = 1. The device provides resistance sink source on VSYS to bring down the VSYS voltage. The device resumes to normal operation when VSYS voltage drops below the VSYS_OVP falling threshold.

16.26.7 VSYS Undervoltage Protection

The device monitors VSYS output voltage to provide VSYS undervoltage protection. If VSYS voltage is under VSYS_UVP threshold, the device stops switching and an INT pulse is asserted to the host. If short circuit is detected on VSYS, the converter will hiccup 7 times. If converter retries are not successful, EN_HZ bit will be setting to 1 to enter HZ mode. Re-plug in adapter or set EN_HZ to 0 can exit HZ mode and the converter restarts to switch. The hiccup can be disabled by DIS_VSYS_UVP_HICCUP to 1; when hiccup is disabled, the converter continues switching even if VSYS voltage is under VSYS_UVP threshold.

16.26.8 VSYS Short Protection

The device monitors VSYS output voltage to provide VSYS short circuit protection. The VSYS short protection can only be enabled by the following setting:

1. The device must have SHIPFET
2. The register SHIP_FET_PRESENT must be set to 1

When short circuit is detected on VSYS, the device will set SDRV_CTRL to 10 to immediately enter Ship Mode to turn off SHIPFET and an INT pulse is asserted to the host to indicate VSYS_SHORT.

16.26.9 VBAT Overvoltage Protection

If VBAT voltage is over VBAT_OVP rising threshold, the device stops switching immediately and an INT pulse is asserted to the host. When VBAT is overvoltage, the status VBAT_OVP_STAT = 1. The device provides resistance sink source on VBAT to bring down the VBAT voltage. The device resumes to normal operation when VBAT voltage drops below the VBAT_OVP falling threshold.

16.26.10 IBAT Overcurrent Protection

The system overload protection can only be enabled by the following setting:

1. The device must have SHIPFET
2. The register SHIP_FET_PRESENT must be set to 1
3. The register EN_BATOC must be set to 1

When the system is overloaded ($IBAT > IOCP_BATFET$), the device will set SDRV_CTRL to 10 to immediately enter Ship Mode to turn off SHIPFET and an INT pulse is asserted to the host to indicate IBAT_OCP.

16.26.11 Thermal Protection in Charge Mode

The device monitors the internal junction temperature to avoid overheat. When in charge mode, the thermal regulation threshold is set at 120°C (programmable by register THREG bits). When junction temperature exceeds thermal regulation threshold, the device decreases the input current limit. During thermal regulation, EOC function is disabled, the safety timer's counter clock rate will be half and an INT is asserted to the host indicate THREG.

The thermal regulation protection activates when EN_AICR = 1.

In addition, the device has thermal shutdown protection, the thermal shutdown threshold is set at 150°C (programmable by register TOTP bits). When the IC junction temperature exceeds thermal shutdown threshold, the

converter turns off immediately and an INT is asserted to the host indicate TOTP fault. The converter is recovered when the junction temperature is below TOTP - TOTP_HYS.

16.26.12 Thermal Protection in OTG Mode

The device monitors the internal junction temperature to avoid overheat. When in OTG mode, the thermal regulation threshold is set at 120°C (programmable by register THREG bits). When junction temperature exceeds thermal regulation threshold, the device decreases the output current limit, and an INT is asserted to the host to indicate THREG.

The thermal regulation protection activates when IBAT_REG does not set at disable.

In addition, the device also has thermal shutdown protection in OTG mode.

16.26.13 Poor Source Detect Protection

The device supports source sink on VBUS to detect whether the adapter is poor source or not. When poor source is detected, the device will hiccup 8 times. If device retries are not successful, the device will set EN_HZ = 1 and an INT is asserted to the host to indicate BAD_ADAPTER.

Table 11. Protection Summary

Channel	Threshold (Typical)	Deglintch (Typical)	Protection	Reset and Threshold (Typical)
VBUS_OVP	VBUS_OVP rising	NA	Converter stop switching	VBUS_OVP falling
VAC_OVP	VAC_OVP rising	NA	Disable ACDRV1 or ACDRV2 to turn off external MOSFET	VAC_OVP falling
IBUS_OCP	IBUS_OCP rising	2ms	REG0x0F[2] = 1 to enter HZ to stop converter switching, and disable ACDRV1 or ACDRV2 to turn off external MOSFET.	NA
OTG_OVP	VOTG_OVP rising	NA	Converter stop switching	VOTG_OVP falling
OTG_UVP	VOTG_UVP falling	10ms	Converter start hiccup, after hiccup 7 times, REG0x12[6] = 0 to disable OTG. Hiccup can be programmed in REG0x13[2].	VOTG_UVP rising
SYS_OVP	VSYS_OVP rising	128μs	Converter stop switching	VSYS_OVP falling
SYS_UVP	VSYS_SHORT falling	64μs	Converter start hiccup, after hiccup 7 times, REG0x0F[2] = 1 to enter HZ to stop converter switching. Hiccup can be programmed in REG0x13[3].	VSYS_SHORT rising
SYS_SHORT	VBAT - VSYS rising to 200mV	128μs	With external SHIPFET, when trigger SYS_SHORT, the SDRV_CTRL enter Ship mode. The SYS_SHORT protect must set REG0x14[7] to 1.	NA
VBAT_OVP	VBAT_OVP rising	2ms	Converter stop switching	VBAT_OVP falling

Channel	Threshold (Typical)	Deglintch (Typical)	Protection	Reset and Threshold (Typical)
IBAT_OCP	I _{OCP_BATFET} rising	3ms	With external SHIPFET, when trigger IBAT_OCP, the SDRV_CTRL enter Ship mode. The IBAT_OCP protect must have to set REG0x14[7] to 1.	NA
Thermal Regulation	T _{J_THREG} rising	32ms	Limit converter output power	T _{J_THREG} falling
Poor Source Detect	V _{BUS_MIN} falling	30ms	When poor source is detected, after 8 times hiccup, REG0x0F[2] = 1 to enter HZ.	V _{BUS_MIN} rising

16.27 Communication Interface

The device uses I²C compatible interface by 2-wire line (SCL and SDA) to communicate with the host. The SCL and SDA pins are open drain, which needs to connect to supply voltage by pull-up resistors. The device operates as an I²C slave device with 7-bits address 53H, supports up to 3.4MHz conditionally. To start an I²C communication, beginning with START (S) condition, and then the host sends slave address. This address is 7-bit long followed by an eighth bit which is a data direction bit (R/W). The second bytes is register address. The third byte contains data to the selected register. End with STOP (P) condition.

16.27.1 I²C Time-Out Reset

To avoid I²C hang-ups, a timer runs during I²C activity. If the SDA keeps low longer than 1 second, the device will reset I²C to release SDA to go back to High. The I²C hang-ups reset function can be disabled by register DIS_I2C_TO = 1.

16.28 Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature $T_{J(MAX)}$, listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 130°C. The junction-to-ambient thermal resistance, θ_{JA} , is highly package dependent. For a VQFN-29TL 4x4 (FC) package, the thermal resistance, θ_{JA} , is 44°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at $T_A = 25^\circ\text{C}$ can be calculated as below:

$$P_{D(MAX)} = (130^\circ\text{C} - 25^\circ\text{C}) / (44^\circ\text{C/W}) = 2.38\text{W for a VQFN-29TL 4x4 (FC) package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed $T_{J(MAX)}$ and the thermal resistance, θ_{JA} . The derating curve in [Figure 10](#) allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

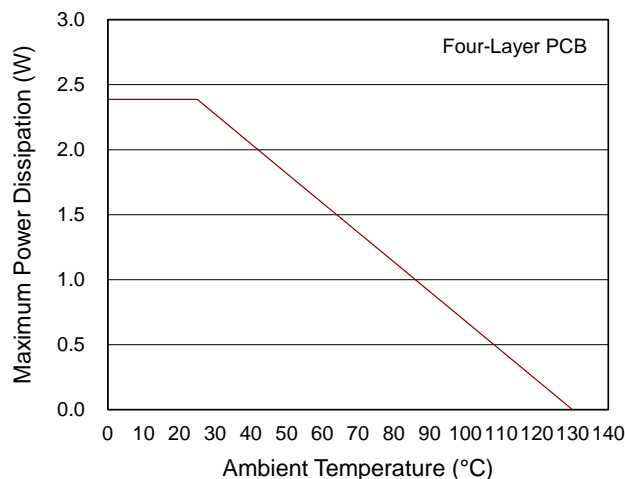

Figure 10. Derating Curve of Maximum Power Dissipation

16.29 Layout Considerations

The RT9492 layout guidelines are shown as below, and there are several suggestions provided.

- The capacitors connected to the PMID pin needs to be placed as close as possible to the IC.
- The inductor connected to the SW pin needs to not only router the trace as short as possible to reduce the EMI but also make sure copper area of the trace is wide enough for the operating current.
- The capacitors connected to the VSYS pin needs to be placed as close as possible to the IC. Three 10 μF capacitors on Top, and two capacitors on Bottom.
- The capacitors connected to the VBAT pin needs to be placed as close as possible to the IC.
- The 0.1 μF capacitor, connected to VAC1/VAC2, PMID and VSYS must be placed close to the IC.
- The GND needs to connect on TOP layer with PMID and SYS capacitors, use ground vias to connect to main

ground as close as possible to the IC.

V-Type 29TL QFN 4x4 Package (FC)

19 Footprint Information

Package	Number of Pin	Tolerance
V/W/U/XQFN4x4-29T(FC)	29	±0.05

20 Packing Information

20.1 Tape and Reel Data

Package Type	Tape Size (W1) (mm)	Pocket Pitch (P) (mm)	Reel Size (A)		Units per Reel	Trailer (mm)	Leader (mm)	Reel Width (W2) Min./Max. (mm)
			(mm)	(in)				
QFN/DFN 4x4	12	8	180	7	1,500	160	600	12.4/14.4

C, D, and K are determined by component size.
The clearance between the components and the cavity is as follows:
- For 12mm carrier tape: 0.5mm max.

Tape Size	W1		P		B		F		ØJ		H
	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Max.	
12mm	12.3mm	7.9mm	8.1mm	1.65mm	1.85mm	3.9mm	4.1mm	1.5mm	1.6mm	0.6mm	

20.2 Tape and Reel Packing

Step	Photo/Description	Step	Photo/Description
1	 <p>Reel 7"</p>	4	 <p>3 reels per inner box Box A</p>
2	 <p>HIC & Desiccant (1 Unit) inside</p>	5	 <p>12 inner boxes per outer box</p>
3	 <p>Caution label is on backside of Al bag</p>	6	 <p>Outer box Carton A</p>

Package	Reel		Box			Carton		
	Size	Units	Item	Reels	Units	Item	Boxes	Unit
QFN/DFN 4x4	7"	1,500	Box A	3	4,500	Carton A	12	54,000
			Box E	1	1,500	For Combined or Partial Reel.		

20.3 Packing Material Anti-ESD Property

Surface Resistance	Aluminum Bag	Reel	Cover tape	Carrier tape	Tube	Protection Band
Ω/cm^2	10^4 to 10^{11}	10^4 to 10^{11}	10^4 to 10^{11}	10^4 to 10^{11}	10^4 to 10^{11}	10^4 to 10^{11}
