

## 36 CHANNELS LED DRIVER EVALUATION BOARD GUIDE

### DESCRIPTION

IS31FL3236A is comprised of 36 constant current channels each with independent PWM control, designed for driving LEDs, PWM frequency can be 3kHz or 22kHz. The output current of each channel can be set at up to 38mA (Max.) by an external resistor and independently scaled by a factor of 1, 1/2, 1/3 and 1/4. The average LED current of each channel can be changed in 256 steps by changing the PWM duty cycle through an I2C interface.

The chip can be turned off by pulling the SDB pin low or by using the software shutdown feature to reduce power consumption.

### FEATURES

- 2.7V to 5.5V supply
- I2C interface, automatic address increment function
- Four selectable I2C addresses
- SDB rising edge reset I2C module
- Internal reset register
- Modulate LED brightness with 256 steps PWM
- Each channel can be controlled independently
- Each channel can be scaled independently by 1, 1/2, 1/3 and 1/4
- PWM frequency selectable
  - 3kHz (default)
  - 22kHz
- -40°C to +85°C temperature range

### QUICK START

Figure 1: Photo of IS31FL3236A Evaluation Board  
(Please refer to Appendix I if MCU is LPC922)

### RECOMMENDED EQUIPMENT

- 5.0V, 2A power supply

### ABSOLUTE MAXIMUM RATINGS

- $\leq 5.5V$  power supply

**Caution:** Do not exceed the conditions listed above, otherwise the board will be damaged.

### PROCEDURE

The IS31FL3236A evaluation board is fully assembled and tested. Follow the steps listed below to verify board operation.

**Caution:** Do not turn on the power supply until all connections are completed.

- 1) Connect the ground terminal of the power supply to the GND and the positive terminal to the VCC. Or connect the DC power to the connector (DC IN) (From version V01C the DC in is replaced by a Micro-USB power in.).
- 2) Turn on the power supply and pay attention to the supply current. If the current exceeds 1.2A, please check for circuit fault.
- 3) Enter the desired mode of display by toggling the MODE button.

### EVALUATION BOARD OPERATION

The IS31FL3236A evaluation board has six display modes. Toggling the MODE button (K1) can switch the modes.

- 1) (Default mode) The 12 RGB LEDs in the middle of the board show a color changing light bar moving pattern.
- 2) Two groups of blue LEDs display a tailing effect moving from right to left.
- 3) Two groups of blue LEDs display a tailing effect moving in opposite directions.
- 4) Blue LEDs perform digital number display.
- 5) Two groups of blue LEDs flash together from two sides to middle and then turn off slowly from both sides to middle.
- 6) The blue LEDs are put into four '8' digits and to show a twist light effect.

**Note:** IS31FL3236A solely controls the FxLED function on the evaluation board.

### ORDERING INFORMATION

Part No.	Temperature Range	Package
IS31FL3236A-QFLS2-EB	-40°C to +85°C (Industrial)	QFN-44, Lead-free

## 36 CHANNELS LED DRIVER EVALUATION BOARD GUIDE

### SOFTWARE SUPPORT

JP1 default setting is shorted. If it is set to open, the SDA, SCL and SDB pin are set to high impedance and the on-board MCU will be idle. External I2C and SDB signals can be connected to TP4 to control the IS31FL3236A LED driver. During external control mode, toggling the MODE button (K1) can switch the power of single blue color LED and power of RGB LED.

**Figure 2: Photo of Arduino UNO connected to Evaluation Board**

The steps listed below are an example using the Arduino for external control.

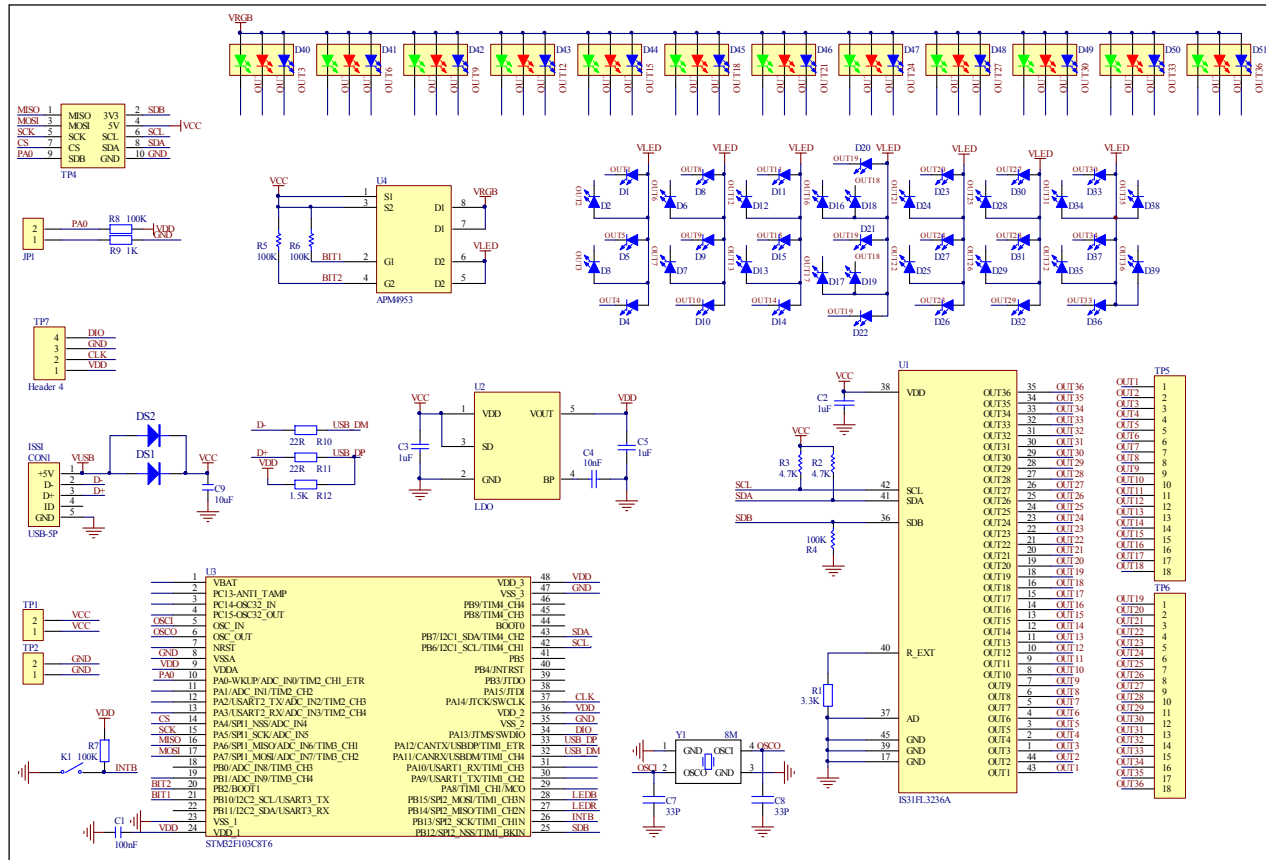

The Arduino hardware consists of an Atmel microcontroller with a bootloader allowing quick firmware updates. First download the latest Arduino Integrated Development Environment IDE (1.6.12 or greater) from [www.arduino.cc/en/Main/Software](http://www.arduino.cc/en/Main/Software). Also download the Wire.h library from [www.arduino.cc/en/reference/wire](http://www.arduino.cc/en/reference/wire) and verify that pgmspace.h is in the directory ...program Files(x86)/Arduino/hardware/tools/avr/avr/include/avr/. Then download the latest Arduino IS31FL3236A test firmware (sketch) from the Lumissil website <http://www.lumissil.com/products/led-driver/fxled>.

- 1) Open JP1.
- 2) Connect the 5 pins from Arduino board to IS31FL3236A EVB:
  - a) Arduino 5V pin to IS31FL3236A EVB VCC.
  - b) Arduino GND to IS31FL3236A EVB GND.
  - c) Arduino SDA (A4) to IS31FL3236A EVB SDA.
  - d) Arduino SCL (A5) to IS31FL3236A EVB SCL.
  - e) If Arduino uses 3.3V MCU VCC, connect 3.3V to IS31FL3236A EVB SDB, if Arduino uses 5.0V MCU VCC, connect 5.0V to EVB SDB.  
(Arduino UNO MCU VCC is 5V, so SDB can be 5V or 3.3V)
- 3) Use the test code in appendix II or download the test firmware (sketch) from the Lumissil website, and copy the code to Arduino IDE, compile and upload to Arduino.
- 4) Run the Arduino code for desired mode setting by Arduino code.
- 5) During external control mode, toggling the MODE button (K1) can switch the power of single color LEDs and power of RGB LEDs.  
(Some early version boards control the single color LEDs or RGB LEDs only, to switch between single color LEDs and RGB power, need to remove U4 and connect VCC to PIN7&8(RGB) or PIN5&6(Single color LED) on U4.)

**Please refer to the datasheet to get more information about IS31FL3236A.**

## 36 CHANNELS LED DRIVER EVALUATION BOARD GUIDE

### EVALUATION BOARD OPERATION

The IS31FL3236A evaluation board has six display modes. Toggling the MODE button (K1) can switch the modes.

- 1) (Default mode) The 12 RGB LEDs in the middle of the board show a color changing light bar moving pattern.
- 2) Two groups of blue LEDs display a tailing effect moving from right to left.
- 3) Two groups of blue LEDs display a tailing effect moving in opposite directions.
- 4) Blue LEDs perform digital number display.
- 5) Two groups of blue LEDs flash together from two sides to middle and then turn off slowly from both sides to middle.
- 6) The blue LEDs are put into four '8' digits and to show a twist light effect.

**Note:** IS31FL3236A solely controls the FxLED function on the evaluation board.

### SOFTWARE SUPPORT

JP1 default setting is close circuit. If it is set to open, the on-board MCU will stop working. The I2C pins and SDB pin are set to High Impedance. External I2C and SDB signals can be connected to TP3 to control the IS31FL3236A LED driver.

Figure 9: Photo of Arduino UNO connected to Evaluation Board

The steps listed below are an example using the Arduino for external control.

The Arduino hardware consists of an Atmel microcontroller with a bootloader allowing quick firmware updates. First download the latest Arduino Integrated Development Environment IDE (1.6.12 or greater) from [www.arduino.cc/en/Main/Software](http://www.arduino.cc/en/Main/Software). Also download the Wire.h library from [www.arduino.cc/en/reference/wire](http://www.arduino.cc/en/reference/wire) and verify that pgmspace.h is in the directory ...program Files(x86)/Arduino/hardware/tools/avr/avr/include/avr/. Then download the latest IS31FL3236A test firmware (sketch) from the Lumissil website <http://www.lumissil.com/products/led-driver/fxled>.

- 1) Open JP1.
- 2) Connect the 5 pins from Arduino board to IS31FL3236A EVB:
  - a) Arduino 5V pin to IS31FL3236A EVB VCC (TP1).
  - b) Arduino GND to IS31FL3236A EVB GND (TP2).
  - c) Arduino SDA (A4) to IS31FL3236A EVB SDA.
  - d) Arduino SCL (A5) to IS31FL3236A EVB SCL.
  - e) If Arduino use 3.3V MCU VCC, connect 3.3V to IS31FL3236A EVB SDB, if Arduino use 5.0V MCU VCC, connect 5.0V to EVB SDB.

(Arduino UNO MCU VCC is 5V, so SDB can be 5V or 3.3V)

- 3) Use the test code in appendix II or download the test firmware (sketch) from the Lumissil website, a .txt file and copy the code to Arduino IDE, compile and upload to Arduino.
- 4) Run the Arduino code and the initial mode will change the RGB LED brightness every second. Note: the white color LEDs cannot be controlled when the onboard LPC922 is disabled.

(Some early board we provided is still controlling the single color LED, if want to switch between single color LED and RGB, remove the U4 and connect the VCC to the LED+)

**Please refer to the datasheet to get more information about IS31FL3236A.**
