

MAX32680 Evaluation Kit

Evaluates: MAX32680

General Description

The MAX32680 evaluation kit (EV kit) provides a platform for evaluation capabilities of the MAX32680 microcontroller, which is an advanced system-on-chip (SoC) designed for industrial and medical sensors. Power regulation and management is provided by a single-inductor multiple-output (SIMO) buck regulator system and contains the latest generation Bluetooth® 5.2 Low Energy (LE) radio.

EV Kit Contents

- MAX32680 EV Kit Containing a MAX32680 with a Preprogrammed Demo
- MAX32625PICO Debugger w/Cables
- One USB Standard-A-to-Micro-B Cable

[Ordering Information](#) appears at end of data sheet.

Features

- SMA Connector for Attaching an External Bluetooth Antenna
- 128 x 128 (1.45in) Color TFT Display with SPI Interface
- Two Selectable On-Board, High-Precision Voltage References
- USB 2.0 Micro B to Serial UARTs
- UART1 and LPUART0 Interface is Selectable Through On-Board Jumpers
- All GPIOs Signals Accessed Through 0.1in Headers
- Access to Four Analog Inputs Through SMA Connectors Configured as Differential
- Access to Eight Analog Inputs Through 0.1in Headers Configured as Single-End
- Optional Discrete Filter for the Twelve Analog Inputs
- DAC Accessed Through SMA Connector or Test Point
- 10-Pin SWD Connector
- 10-Pin RV JTAG Connector
- Board Power Provided by USB Port
- On-Board 3.3V LDO Regulator to Power MAX32680 Internal SIMO
- Test Loops Provided to Supply Optional VCORE Power Externally
- Individual Power Measurement on All IC Rails Through Jumpers
- Two General Purpose LEDs and Two General Purpose Pushbutton Switches

The Bluetooth word mark and logos are registered trademarks owned by Bluetooth SIG, Inc. and any use of such marks by Maxim is under license.

MAX32680 EV Kit Board

Quick Start

Required Equipment

- MAX32680 EV kit containing a MAX32680 with a preprogrammed demo
- One USB Standard-A-to-Micro-B cable

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- 1) While observing safe electrostatic discharge (ESD) practices, carefully remove the MAX32680 EV kit board out of its packaging. Inspect the board to ensure that no damage occurred during shipment. Jumpers/shunts are preinstalled prior to testing and packaging.
- 2) Power up the board by plugging in the provided USB cable to connector CN1. Verify that the VBUS blue LED (DS1) and the 3.3V (DS2) green LED are illuminated.
- 3) The MAX32680 is preprogrammed with a demo program. The program now initiates and displays the Maxim logo upon successful completion.

Detailed Description of Hardware (or Software)

Bluetooth 5.2 Interface

The SMA connector (J2) is provided to attach an external Bluetooth 2.4GHz antenna.

Power Supply

The EV kit is powered by +5V which is made available through VBUS on the Micro-USB type-B connector CN1. When the power switch SW3 is in the on position, the blue VBUS LED (DS1) and the green 3.3V LED (DS2) illuminate. The 3.3V powers the SIMO of the MAX32680.

Current Monitoring

A two-pin header VBAT EN (JP1) provides a convenient current monitoring point for the 3.3V LDO powering the MAX32680. If the jumper is removed, power can be sourced externally.

Low-Power Mode Current Measurements

To accurately achieve the low power current values, the EV kit needs to configure such that no outside influence (i.e., pullups, external clock, debugger connector, etc.) causes a current source or sink on that GPIO.

For these measurements, the board is needed to be configured as follows:

- 1) Remove jumpers JP8, JP9, JP10, JP11, JP12, JP14, JP22, JP23, and JP24.
- 2) Unplug the SWD connector at JH10.
- 3) Unplug the RV JTAG connector at JH11.

Clocking

The MAX32680 clocking is provided by an external 32MHz crystal (Y1).

Voltage Reference Selection

The external voltage reference inputs REF0P, REF0N, REF1P, and REF1N for the analog-to-digital converters (ADCs) can be sourced externally by high precision external reference sources, MAX6071 (U2 and U3), REF0P (JP2), and REF1P (JP6) or internally by VDDA.

JTAG Serial Wire Debug (SWD) Support

The SWD debug can be accessed through a Cortex® 10-pin connector (JH10). Logic levels are set to 1.8V (VDDIO_AUX).

JTAG RISC V Debug (SWD) Support

The JTAG RISC V debug can be accessed through a Cortex 10-pin connector (JH11). Logic levels are set to 1.8V (VDDIO_AUX).

UART Interface

The EV kit provides a USB-to-UART bridge chip, FTDI FT230XS-R. This bridge eliminates the requirement for a physical RS-232 COM port. Instead, the IC's UART access is through the Micro-USB type-B connector, CN1. The USB-to-UART bridge can be connected to the ICs UART1 or LPUART with jumpers JP22 (RX) and JP23 (TX). Virtual COM port drivers and guides for installing Windows® drivers are available at the FTDI chip website.

GPIO and Alternate Function Headers

The GPIO and Alternate Function signals from the MAX32680 can be accessed through 0.1in spaced headers JH1 through JH5.

Analog Headers

The four analog inputs (AIN0–AIN3) are accessed through differential SMA connectors J3 and J4 or test loops TP3 through TP5. The eight analog inputs (AIN4–AIN11) are accessed single-ended through 0.1in headers JH6 and JH7.

DAC12 OUT

The DAC12 output can be accessed through SMA connector J1 or test loop (TP1).

I²C Pullups

The I²C ports can be independently pulled up to 1.8V (VDDIO_AUX) or 3.3V through JP8 and JP9.

Reset Pushbutton

The IC can be reset by pushbutton SW4.

Indicator LEDs

General purpose indicators LED D1 (red) is connected to GPIO P0.24 and LED D2 (green) is connected to GPIO P0.25.

GPIO Pushbutton Switches

The two general purpose pushbuttons SW1 and SW2 are connected to GPIO P0.26 and P0.27, respectively. If the pushbutton is pressed, the attached port pin is pulled low.

Cortex is a registered trademark of ARM Limited (or its subsidiaries) in the US and/or elsewhere.

Windows is a registered trademark and registered service mark of Microsoft Corporation.

Table 1. MAX32680 EV Kit Jumper Settings

JUMPER	SIGNAL	SETTINGS	DESCRIPTION
JP1	VREGI	Open	Disconnects 3.3V power from the MAX32680 SIMO
		Close*	Connects 3.3V power to the MAX32680 SIMO
JP2	REF0P	2-1*	Connects the external high-precision voltage reference to REF0P
		2-3	Connects the internal voltage reference to REF0P
JP3	REF0N	Open*	Disconnects REF0N from ground
		Close	Connects REF0N to ground
JP4	VDDIO_AUX	Open*	Disconnects VDDIO_AUX from pull-ups and reference voltages
		Close	Connects VDDIO_AUX to pull-ups and reference voltages
JP5	VDDIOH	Open*	Connects VREGO_A to VDDIOH
		Close	Connects the 3.3V from the external LDO to VDDIOH
JP6	REF1P	2-1*	Connects the external high-precision voltage reference to REF1P
		2-3	Connects the internal voltage reference to REF1P
JP7	REF1N	Open*	Disconnects REF1N from ground
		Close	Connects REF1N to ground
JP8	I2C0_SDA I2C0_SCL	2-1	Connects I2C0 pullups to VDDIO_AUX (1.8V)
		2-3	Connects I2C0 pullups to 3.3V
JP9	I2C1_SDA I2C1_SCL	2-1	Connects I2C1 pullups to VDDIO_AUX (1.8V)
		2-3	Connects I2C1 pullups to 3.3V
JP10	P0_24	Open	Disconnects red LED D1 from P0_24
		Close*	Connects red LED D1 to P0_24
JP11	P0_25	Open	Disconnects green LED D2 from P0_25
		Close*	Connects green LED D2 to P0_25
JP12	FSK_IN	Open	Disconnects FSK_IN from HART analog circuitry
		Close*	Connects FSK_IN to HART analog circuitry
JP13	RCV_FSK	Open*	Disconnects RCV_FSK from CC LOOP
		Close	Connects RCV_FSK to CC LOOP
JP14	FSK_OUT	Open	Disconnects FSK_OUT from HART analog circuitry
		Close*	Connects FSK_OUT to HART analog circuitry
JP15	RCV_FSK	Open	Disconnects RCV_FSK from XFMR LOOP
		Close*	Connects RCV_FSK to XFMR LOOP
JP16	RLOAD	Open*	Disconnects 249 ohm resistor shunt from CC LOOP
		Close	Connects 249 ohm resistor shunt to CC LOOP
JP17	FSK AMP GAIN	Open*	Enables FSK variable amp gain
		Close	Disables FSK variable amp gain
JP18	AMP BYPASS	2-1*	Enables FSK amp
		2-3	Bypasses FSK amp
JP19	FSK AMP GAIN	Open*	Enables FSK fixed amp gain
		Close	Disables FSK fixed amp gain

Table 1. MAX32680 EV Kit Jumper Settings (continued)

JUMPER	SIGNAL	SETTINGS	DESCRIPTION
JP20	HART_RTS	Open*	Enables HART_RTS optical transceiver
		Close	Bypasses HART_RTS optical transceiver
JP21	RLOAD	Open	Disconnects 249 ohm resistor shunt from XFMR LOOP
		Close*	Connects 249 ohm resistor shunt to XFMR LOOP
JP22	UART0_RX	2-1*	Disconnects the USB - serial bridge from UART1_RX (P0.12)
		2-3	Connects the USB - serial bridge to LPUART_RX (P2.6)
JP23	UART0_TX	2-1*	Disconnects the USB - serial bridge from UART1_TX (P0.13)
		2-3	Connects the USB - serial bridge to LPUART_TX (P2.7)
JP24	HART_IN	Open	Disconnects TX of USB - serial bridge from HART_IN (P0.1)
	HART_IN	1-2*	Connects TX of USB - serial bridge to HART_IN (P0.1)
	HART_OUT	Open	Disconnects RX of USB - serial bridge from HART_OUT (P0.0)
	HART_OUT	2-3*	Connects RX of USB - serial bridge to HART_OUT (P0.0)
	HART_RTS	Open	Disconnects RTS of USB - serial bridge from HART_RTS (P0.3)
	HART_RTS	3-4*	Connects TX of USB - serial bridge to HART_RTS (P0.3)
	HART_OCD	Open	Disconnects RTS of USB - serial bridge from HART_OCD (P0.2)
	HART_OCD	4-5*	Connects TX of USB - serial bridge to HART_OCD (P0.2)
JP25	RSTN	Open*	Disconnects DUT_3V3_RSTN from RSTN
		Close	Connects DUT_3V3_RSTN to RSTN
