Please consult the approval sheet before ordering.
Please read rating and !Cautions first.

■ Specifications and Test Methods

| No	Item		Specification	Test Method (Ref. Standard:JIS C 5101, IEC60384)
1	Rated Voltage		Shown in Rated value.	The rated voltage is defined as the maximum voltage which may be applied continuously to the capacitor. When AC voltage is superimposed on DC voltage, V^{P-P} or V^{O-P}, whichever is larger, should be maintained within the rated voltage range.
2	Appearance		No defects or abnormalities.	Visual inspection.
3	Dimension		Within the specified dimensions.	Using Measuring instrument of dimension.
4	Voltage proof		No defects or abnormalities.	Measurement Point : Between the terminations Test Voltage : 300% of the rated voltage Applied Time : 1s to 5 s Charge/discharge current : 50mA max.
5	Insulation Resistance(I.R.)		$C \leqq 0.047\mu F$:More than $10000M\Omega$ $C > 0.047\mu F$:More than $500\Omega \cdot F$ C:Nominal Capacitance	Measurement Point : Between the terminations Measurement Voltage : DC Rated Voltage Charging Time : 2 min Charge/discharge current : 50mA max. Measurement Temperature : Room Temperature
6	Capacitance		Shown in Rated value.	Measurement Temperature : Room Temperature
7	Q		30pF and over:$Q \geqq 1000$ 30pF and below:$Q \geqq 400+20C$ C:Nominal Capacitance(pF)	<table><tr><th>Capacitance</th><th>Frequency</th><th>Voltage</th></tr><tr><td>$C \leqq 1000pF$</td><td>1.0+/-0.1MHz</td><td>0.5 to 5.0Vrms</td></tr></table>
8	Temperature Characteristics of Capacitance		Nominal values of the temperature coefficient is shown in Rated value. But,the Capacitance Change under 20℃ is shown in Table A. Capacitance Drift Within +/-0.2% or +/-0.05pF (Whichever is larger.)	The capacitance change should be measured after 5 minutes at each specified temp. stage. Capacitance value as a reference is the value in step 3. The capacitance drift is calculated by dividing the differences between the maximum and minimum measured values in the step 1,3 and 5 by the cap. value in step 3. <table><tr><th>Step</th><th>Temperature(℃)</th></tr><tr><td>1</td><td>Reference Temp.+/-2</td></tr><tr><td>2</td><td>Min. Operating Temp.+/-3</td></tr><tr><td>3</td><td>Reference Temp.+/-2</td></tr><tr><td>4</td><td>Max. Operating Temp.+/-3</td></tr><tr><td>5</td><td>Reference Temp.+/-2</td></tr></table>
9	Adhesive Strength of Termination		No removal of the terminations or other defect should occur.	Solder the capacitor on the test substrate shown in Fig.3. <table><tr><th>Type</th><th>Applied Force(N)</th></tr><tr><td>GJM02</td><td>1</td></tr><tr><td>GJM03</td><td>2</td></tr><tr><td>GJM15</td><td>5</td></tr></table> Holding Time : 10+/-1s Applied Direction : In parallel with the test substrate and vertical with the capacitor side.
10	Vibration	Appearance	No defects or abnormalities.	Solder the capacitor on the test substrate shown in Fig.3.
		Capacitance	Within the specified initial value.	Kind of Vibration : A simple harmonic motion 10Hz to 55Hz to 10Hz (1min)
		Q	Within the specified initial value.	Total amplitude : 1.5mm This motion should be applied for a period of 2h in each 3 mutually perpendicular directions(total of 6h).
11	Substrate Bending test	Appearance	No defects or abnormalities.	Solder the capacitor on the test substrate shown in Fig.1.
		Capacitance Change	Within +/-5% or +/-0.5pF (Whichever is larger)	Pressurization method : Shown in Fig.2 Flexure : 1mm Holding Time : 5+/-1s Soldering Method : Reflow soldering
12	Solderability		95% of the terminations is to be soldered evenly and continuously.	Test Method : Solder bath method Flux Solution of rosin ethanol 25(mass)% Preheat : 80℃ to 120℃ for 10s to 30s Solder : Sn-3.0Ag-0.5Cu Solder Temp. : 245+/-5℃ Immersion time : 2+/-0.5s

No	Item		Specification	Test Method (Ref. Standard:JIS C 5101, IEC60384）
13	Resistance to Soldering Heat	Appearance	No defects or abnormalities.	<GJM02 size only>
		Capacitance Change	Within +/-2.5% or +/- 0.25pF (Whichever is larger)	Test Method : Reflow soldering (hot plate) Solder : Sn-3.0Ag-0.5Cu Solder Temp. : 270+/-5℃ Reflow Time : 10+/-0.5s
		Q	Within the specified initial value.	Test Substrate : Glass epoxy PCB Exposure Time : 24+/-2h
		I.R.	Within the specified initial value.	Preheat : 120℃ to 150℃ for 1 min
		Voltage proof	No defects.	<GJM03/GJM15 size> Test Method : Solder bath method Solder : Sn-3.0Ag-0.5Cu Solder Temp. : 270+/-5℃ Immersion time : 10+/-0.5s Exposure Time : 24+/-2h Preheat : 120℃ to 150℃ for 1 min
14	Temperature Sudden Change	Appearance	No defects or abnormalities.	Solder the capacitor on the test substrate shown in Fig.3.
		Capacitance Change	Within +/-2.5% or +/- 0.25pF (Whichever is larger)	Perform the five cycles according to the four heat treatments shown in the following table.
		Q	Within the specified initial value.	
		I.R.	Within the specified initial value.	
		Voltage proof	No defects.	

Step	Temp.(℃)	Time (min)

165~180°   Top tape

1.13 Label that show the customer parts number, our parts number, our company name, inspection
     number and quantity, will be put in outside of reel.

■Limitation of Applications
Please contact us before using our products for the applications listed below which require especially high reliability
for the prevention of defects which might directly cause damage to the third party's life, body or property.

①Aircraft equipment   ②Aerospace equipment   ③Undersea equipment   ④Power plant control equipment
⑤Medical equipment   ⑥Transportation equipment(vehicles,trains,ships,etc.)   ⑦Traffic signal equipment
⑧Disaster prevention / crime prevention equipment   ⑨Data-processing equipment
⑩Application of similar complexity and/or reliability requirements to the applications listed in the above.

■Storage and Operation condition

1. The performance of chip monolithic ceramic capacitors may be affected by the storage conditions.

1-1. Store the capacitors in the following conditions:
    Room Temperature of +5℃ to +40℃ and a Relative Humidity of 20% to 70%.

 (1) Sunlight, dust, rapid temperature changes, corrosive gas atmosphere, or high temperature and humidity
    conditions during storage may affect solderability and packaging performance.
    Therefore, please maintain the storage temperature and humidity. Use the product within six months after receipt ,
    as prolonged storage may cause oxidation of the terminations (outer electrodes).
 (2) Please confirm solderability before using after six months.
    Store the capacitors without opening the original bag.
    Even if the storage period is short, do not exceed the specified atmospheric conditions.

1-2. Corrosive gas can react with the termination (external) electrodes or lead wires of capacitors, and result
    in poor solderability. Do not store the capacitors in an atmosphere consisting of corrosive gas (e.g.,hydrogen
    sulfide, sulfur dioxide, chlorine, ammonia gas etc.).

1-3. Due to moisture condensation caused by rapid humidity changes, or the photochemical change caused
    by direct sunlight on the terminal electrodes and/or the resin/epoxy coatings, the solderability and
    electrical performance may deteriorate. Do not store capacitors under direct sunlight or in high huimidity
    conditions

■Rating

1.Temperature Dependent Characteristics

1. The electrical characteristics of the capacitor can change with temperature.

1-1. For capacitors having larger temperature dependency, the capacitance may change with temperature
    changes. The following actions are recommended in order to ensure suitable capacitance values.
 (1) Select a suitable capacitance for the operating temperature range.
 (2) The capacitance may change within the rated temperature.
    When you use a high dielectric constant type capacitor in a circuit that needs a tight (narrow) capacitance
    tolerance (e.g., a time-constant circuit), please carefully consider the temperature characteristics, and
    carefully confirm the various characteristics in actual use conditions and the actual system.

[Example of Temperature Caracteristics X7R(R7)]   [Example of Temperature Characteristics X5R(R6)]
 Sample: 0.1μF, Rated Voltage 50VDC   Sample: 22μF, Rated Voltage 4VDC

2.Measurement of Capacitance

1. Measure capacitance with the voltage and frequency specified in the product specifications.

 1-1. The output voltage of the measuring equipment may decrease occasionally when capacitance is high.
    Please confirm whether a prescribed measured voltage is impressed to the capacitor.
 1-2. The capacitance values of high dielectric constant type capacitors change depending on the AC voltage applied.
    Please consider the AC voltage characteristics when selecting a capacitor to be used in a AC circuit.

3.Applied Voltage

1. Do not apply a voltage to the capacitor that exceeds the rated voltage as called out in the specifications.

 1-1. Applied voltage between the terminals of a capacitor shall be less than or equal to the rated voltage.
   (1) When AC voltage is superimposed on DC voltage, the zero-to-peak voltage shall not exceed the rated DC voltage.
      When AC voltage or pulse voltage is applied, the peak-to-peak voltage shall not exceed the rated DC voltage.
   (2) Abnormal voltages (surge voltage, static electricity, pulse voltage, etc.) shall not exceed the rated DC voltage.

Typical Voltage Applied to the DC capacitor

DC Voltage	DC Voltage+AC	AC Voltage	Pulse Voltage

(E : Maximum possible applied voltage.)

 1-2. Influence of over voltage
    Over voltage that is applied to the capacitor may result in an electrical short circuit caused by the breakdown
    of the internal dielectric layers .
    The time duration until breakdown depends on the applied voltage and the ambient temperature.

4.Type of Applied Voltage and Self-heating Temperature

1.Confirm the operating conditions to make sure that no large current is flowing into the capacitor due to the
   continuous application of an AC voltage or pulse voltage.
   When a DC rated voltage product is used in an AC voltage circuit or a pulse voltage circuit, the AC current
   or pulse current will flow into the capacitor; therefore check the self-heating condition.
   Please confirm the surface temperature of the capacitor so that the temperature remains within the upper limits
   of the operating temperature, including the rise in temperature due to self-heating. When the capacitor is
   used with a high-frequency voltage or pulse voltage, heat may be generated by dielectric loss.

<Applicable to Rated Voltage of less than 100VDC>
 1-1. The load should be contained to the level
    such that when measuring at atmospheric
    temperature of 25°C, the product's self-heating
    remains below 20°C and the surface
    temperature of the capacitor in the actual circuit
    remains within the maximum operating
    temperature.

[Example of Temperature Rise (Heat Generation) in Chip
Monolithic Ceramic Capacitors in Contrast to Ripple Current]
Sample: R(R1) characteristics 10μF, Rated voltage: DC10V

Ripple Current

5. DC Voltage and AC Voltage Characteristic

1. The capacitance value of a high dielectric constant type
   capacitor changes depending on the DC voltage applied.
   Please consider the DC voltage characteristics when a
   capacitor is selected for use in a DC circuit.

 1-1. The capacitance of ceramic capacitors may change
      sharply depending on the applied voltage. (See figure)
      Please confirm the following in order to secure the
      capacitance.
   (1) Determine whether the capacitance change caused
       by the applied voltage is within the allowed range .
   (2) In the DC voltage characteristics, the rate of
       capacitance change becomes larger as voltage
       increases, even if the applied voltage is below
       the rated voltage. When a high dielectric constant
       type capacitor is used in a circuit that requires a
       tight (narrow) capacitance tolerance (e.g., a time
       constant circuit), please carefully consider the
       voltage characteristics, and confirm the various
       characteristics in the actual operating conditions
       of the system.

2. The capacitance values of high dielectric
   constant type capacitors changes depending
   on the AC voltage applied.
   Please consider the AC voltage characteristics
   when selecting a capacitor to be used in a
   AC circuit.

[Example of DC Voltage Characteristics]
Sample: X7R(R7) Characteristics 0.1μF, Rated Voltage 50VDC

Capacitance Change (%) vs DC Voltage (V)

[Example of AC Voltage Characteristics]
Sample: X7R(R7) Characteristics 10μF, Rated Voltage 6.3VDC

Capacitance Change (%) vs AC Voltage (Vr.m.s.)

6. Capacitance Aging

1. The high dielectric constant type capacitors
   have an Aging characteristic in which the capacitance
   value decreases with the passage of time.
   When you use a high dielectric constant type
   capacitors in a circuit that needs a tight (narrow)
   capacitance tolerance (e.g., a time-constant circuit),
   please carefully consider the characteristics
   of these capacitors, such as their aging, voltage,
   and temperature characteristics. In addition,
   check capacitors using your actual appliances
   at the intended environment and operating conditions.

[Example of Change Over Time (Aging characteristics)]

Capacitance Change(%) vs Time(h)

C0G(5C)
X7R(R7)
X5R(R6)

7.Vibration and Shock

1. Please confirm the kind of vibration and/or shock, its condition, and any generation of resonance.
   Please mount the capacitor so as not to generate resonance, and do not allow any impact on the terminals.

2. Mechanical shock due to being dropped may cause damage or
   a crack in the dielectric material of the capacitor.
   Do not use a dropped capacitor because the quality and reliability
   may be deteriorated.

Crack

Floor

3. When printed circuit boards are piled up or handled, the corner
   of another printed circuit board
   should not be allowed to hit the capacitor in order to avoid
   a crack or other damage to the capacitor.

Mounting printed circuit board
Crack

■Soldering and Mounting

1.Mounting Position

1. Confirm the best mounting position and direction that minimizes the stress imposed on the capacitor during flexing or bending the printed circuit board.

1-1.Choose a mounting position that minimizes the stress imposed on the chip during flexing or bending of the board.
[Component Direction]

Locate chip horizontal to the direction in which stress acts.

(Bad Example)   (Good Example)

[Chip Mounting Close to Board Separation Point]
It is effective to implement the following measures, to reduce stress in separating the board.
It is best to implement all of the following three measures; however, implement as many measures as possible to reduce stress.

Contents of Measures	Stress Level
(1) Turn the mounting direction of the component parallel to the board separation surface.	A ＞ D *1
(2) Add slits in the board separation part.	A ＞ B
(3) Keep the mounting position of the component away from the board separation surface.	A ＞ C

Perforation

C

B

A

Slit

D

*1 A > D is valid when stress is added vertically to the perforation as with Hand Separation.
If a Cutting Disc is used, stress will be diagonal to the PCB, therefore A > D is invalid.

[Mounting Capacitors Near Screw Holes]
When a capacitor is mounted near a screw hole, it may be affected by the board deflection that occurs during the tightening of the screw. Mount the capacitor in a position as far away from the screw holes as possible.

Screw Hole   Recommended

2.Information before Mounting

1. Do not re-use capacitors that were removed from the equipment.

2. Confirm capacitance characteristics under actual applied voltage.

3. Confirm the mechanical stress under actual process and equipment use.

4. Confirm the rated capacitance, rated voltage and other electrical characteristics before assembly.

5. Prior to use, confirm the solderability of capacitors that were in long-term storage.

6. Prior to measuring capacitance, carry out a heat treatment for capacitors that were in long-term storage.

7.The use of Sn-Zn based solder will deteriorate the reliability of the MLCC.
Please contact our sales representative or product engineers on the use of Sn-Zn based solder in advance.

3.Maintenance of the Mounting (pick and place) Machine

1. Make sure that the following excessive forces are not applied to the capacitors.

  1-1. In mounting the capacitors on the printed circuit board, any bending force against them shall be kept
       to a minimum to prevent them from any damage or cracking. Please take into account the following precautions
       and recommendations for use in your process.

   (1) Adjust the lowest position of the pickup nozzle so as not to bend the printed circuit board.

   (2) Adjust the nozzle pressure within a static load of 1N to 3N during mounting.

[Incorrect] Suction Nozzle

Deflection

Board

Board Guide

[Correct]

Support Pin

2.Dirt particles and dust accumulated between the suction nozzle and the cylinder inner wall prevent
  the nozzle from moving smoothly. This imposes greater force upon the chip during mounting,
  causing cracked chips. Also, the locating claw, when worn out, imposes uneven forces on the chip
  when positioning, causing cracked chips. The suction nozzle and the locating claw must be maintained,
  checked and replaced periodically.

4-1.Reflow Soldering

1. When sudden heat is applied to the components, the mechanical strength of the components will decrease because a sudden temperature change causes deformation inside the components. In order to prevent mechanical damage to the components, preheating is required for both the components and the PCB. Preheating conditions are shown in table 1. It is required to keep the temperature differential between the solder and the components surface (ΔT) as small as possible.

2. Solderability of tin plating termination chips might be deteriorated when a low temperature soldering profile where the peak solder temperature is below the melting point of tin is used. Please confirm the solderability of tin plated termination chips before use.

3. When components are immersed in solvent after mounting, be sure to maintain the temperature difference (ΔT) between the component and the solvent within the range shown in the table 1.

[Standard Conditions for Reflow Soldering]

[Allowable Reflow Soldering Temperature and Time]

In the case of repeated soldering, the accumulated soldering time must be within the range shown above.

Table 1

Series	Chip Dimension(L/W) Code	Temperature Differential
GJM	02/03/15	ΔT≦190℃

Recommended Conditions

	Lead Free Solder
Peak Temperature	240 to 260℃
Atmosphere	Air or N_2

Lead Free Solder: Sn-3.0Ag-0.5Cu

4. Optimum Solder Amount for Reflow Soldering

4-1. Overly thick application of solder paste results in a excessive solder fillet height.
   This makes the chip more susceptible to mechanical and thermal stress on the board and may cause the chips to crack.

4-2. Too little solder paste results in a lack of adhesive strength on the termination, which may result in chips breaking loose from the PCB.

4-3. Please confirm that solder has been applied smoothly to the termination.

Inverting the PCB

Make sure not to impose any abnormal mechanical shocks to the PCB.

4-2.Flow Soldering

1. This product is not apply flow soldering.

4-3.Correction of Soldered Portion

When sudden heat is applied to the capacitor, distortion caused by the large temperature difference occurs internally, and can be the cause of cracks. Capacitors also tend to be affected by mechanical and thermal stress depending on the board preheating temperature or the soldering fillet shape, and can be the cause of cracks. Please refer to "1. PCB Design" or "3. Optimum solder amount" for the solder amount and the fillet shapes.

1. Correction with a Soldering Iron
  1-1. In order to reduce damage to the capacitor, be sure to preheat the capacitor and the mounting board.
      Preheat to the temperature range shown in Table 3. A hot plate, hot air type preheater, etc. can be used for preheating.
  1-2. After soldering, do not allow the component/PCB to cool down rapidly.
  1-3. Perform the corrections with a soldering iron as quickly as possible. If the soldering iron is applied too long, there is a possibility of causing solder leaching on the terminal electrodes, which will cause deterioration of the adhesive strength and other problems.

Table 3

Series	Chip Dimension (L/W) Code	Temperature of Soldering Iron Tip	Preheating Temperature	Temperature Differential(ΔT)	Atmosphere
GJM	03/15	350℃ max.	150℃ min.	$\Delta T \leqq 190$℃	Air

Lead Free Solder: Sn-3.0Ag-0.5Cu
* Please manage Δ T in the temperature of soldering iron and the preheating temperature.

2. Correction with Spot Heater
  Compared to local heating with a soldering iron, hot air heating by a spot heater heats the overall component and board, therefore, it tends to lessen the thermal shock. In the case of a high density mounted board, a spot heater can also prevent concerns of the soldering iron making direct contact with the component.
 2-1. If the distance from the hot air outlet of the spot heater to the component is too close, cracks may occur due to thermal shock. To prevent this problem, follow the conditions shown in Table 4.
 2-2. In order to create an appropriate solder fillet shape, it is recommended that hot air be applied at the angle shown in Figure 1.

Table 4

Distance	5mm or more
Hot Air Application angle	45° *Figure 1
Hot Air Temperature Nozzle Outlet	400°C max.
Application Time	Less than 10 seconds (1005M / 0402 size or smaller)

(1005M : Metric size code)

[Figure 1]

One-hole Nozzle

an Angle of 45°

3. Optimum solder amount when re-working with a soldering iron
 3-1. If the solder amount is excessive, the risk of cracking is higher during board bending or any other stressful condition. Too little solder amount results in a lack of adhesive strength on the termination, which may result in chips breaking loose from the PCB.
    Please confirm that solder has been applied smoothly is   in section
    and rising to the end surface of the chip.

Solder Amount

 3-2. A soldering iron with a tip of ø3mm or smaller should be used. It is also necessary to keep the soldering iron from touching the components during the re-work.
 3-3. Solder wire with ø0.5mm or smaller is required for soldering.

5.Washing

Excessive ultrasonic oscillation during cleaning can cause the PCBs to resonate, resulting in cracked chips or broken solder joints. Take note not to vibrate PCBs.

6.Electrical Test on Printed Circuit Board

1. Confirm position of the support pin or specific jig, when inspecting the electrical performance of a capacitor after mounting on the printed circuit board.

   1-1. Avoid bending the printed circuit board by the pressure of a test-probe, etc.
      The thrusting force of the test probe can flex the PCB, resulting in cracked chips or open solder joints. Provide support pins on the back side of the PCB to prevent warping or flexing.
      Install support pins as close to the test-probe as possible.

   1-2. Avoid vibration of the board by shock when a test -probe contacts a printed circuit board.

[Not Recommended]   [Recommended]

Peeling   Support Pin

Test-probe   Test-probe

7.Printed Circuit Board Cropping

1. After mounting a capacitor on a printed circuit board, do not apply any stress to the capacitor that caused bending or twisting the board.

   1-1. In cropping the board, the stress as shown may cause the capacitor to crack.
      Cracked capacitors may cause deterioration of the insulation resistance, and result in a short.
      Avoid this type of stress to a capacitor.

[Bending]   [Twisting]

2. Check the cropping method for the printed circuit board in advance.

   2-1. Printed circuit board cropping shall be carried out by using a jig or an apparatus (Disc separator, router type separator, etc.) to prevent the mechanical stress that can occur to the board.

Board Separation Method	Hand Separation Nipper Separation	(1) Board Separation Jig	Board Separation Apparatus	
			2) Disc Separator	3) Router Type Separator
Level of stress on board	High	Medium	Medium	Low
Recommended	×	△*	△*	○
Notes	Hand and nipper separation apply a high level of stress. Use another method.	· Board handling · Board bending direction · Layout of capacitors	· Board handling · Layout of slits · Design of V groove · Arrangement of blades · Controlling blade life	Board handling

* When a board separation jig or disc separator is used, if the following precautions are not observed, a large board deflection stress will occur and the capacitors may crack.
Use router type separator if at all possible.

muRata

(1) Example of a suitable jig

   [In the case of Single-side Mounting]

   An outline of the board separation jig is shown as follows.
   Recommended example: Stress on the component mounting position can be minimized by holding the portion close to the jig, and bend in the direction towards the side where the capacitors are mounted.
   Not recommended example: The risk of cracks occurring in the capacitors increases due to large stress being applied to the component mounting position, if the portion away from the jig is held and bent in the direction opposite the side where the capacitors are mounted.

[Outline of jig]

Printed Circuit Board — V-groove
Board Cropping Jig

[Hand Separation]

Recommended	Not recommended
Printed circuit board — Component — Direction of load — Load point	Load point — Direction of load — Printed circuit board — Components

   [In the case of Double-sided Mounting]

   Since components are mounted on both sides of the board, the risk of cracks occurring can not be avoided with the above method. Therefore, implement the following measures to prevent stress from being applied to the components.
   (Measures)
   (1) Consider introducing a router type separator.
       If it is difficult to introduce a router type separator, implement the following measures.
       (Refer to item 1. Mounting Position)
   (2) Mount the components parallel to the board separation surface.
   (3) When mounting components near the board separation point, add slits in the separation position near the component.
   (4) Keep the mounting position of the components away from the board separation point.

(2) Example of a Disc Separator

   An outline of a disc separator is shown as follows. As shown in the Principle of Operation, the top blade and bottom blade are aligned with the V-grooves on the printed circuit board to separate the board.
   In the following case, board deflection stress will be applied and cause cracks in the capacitors.
   (1) When the adjustment of the top and bottom blades are misaligned, such as deviating in the top-bottom, left-right or front-rear directions
   (2) The angle of the V groove is too low, depth of the V groove is too shallow, or the V groove is misaligned top-bottom
   IF V groove is too deep, it is possible to brake when you handle and carry it. Carefully design depth of the V groove with consideration about strength of material of the printed circuit board.

[Disc Separator]

Recommended	Not recommended		
	Top-bottom Misalignment	Left-right Misalignment	Front-rear Misalignment
Top Blade / Bottom Blade	Top Blade / Bottom Blade	Top Blade / Bottom Blade	Top Blade / Bottom Blade

[V-groove Design]

Example of Recommended V-groove Design	Not Recommended			
	Left-right Misalignment	Low-Angle	Depth too Shallow	Depth too Deep

(3) Example of Router Type Separator
   The router type separator performs cutting by a router
   rotating at a high speed. Since the board does not
   bend in the cutting process, stress on the board can
   be suppressed during board separation.
   When attaching or removing boards to/from the router type
   separator, carefully handle the boards to prevent bending.

[Outline Drawing]   Router

8. Assembly

1. Handling
   If a board mounted with capacitors is held with one hand, the board may bend.
   Firmly hold the edges of the board with both hands when handling.
   If a board mounted with capacitors is dropped, cracks may occur in the capacitors.
   Do not use dropped boards, as there is a possibility that the quality of the capacitors may be impaired.

2. Attachment of Other Components
 2-1. Mounting of Other Components
      Pay attention to the following items, when mounting other components on the back side of the board after
      capacitors have been mounted on the opposite side.
      When the bottom dead point of the suction nozzle is set too low, board deflection stress may be applied
      to the capacitors on the back side (bottom side), and cracks may occur in the capacitors.
      · After the board is straightened, set the bottom dead point of the nozzle on the upper surface of the board.
      · Periodically check and adjust the bottom dead point.

Suction Nozzle

 2-2. Inserting Components with Leads into Boards
      When inserting components (transformers, IC, etc.) into boards, bending the board may cause cracks in the
      capacitors or cracks in the solder. Pay attention to the following.
      · Increase the size of the holes to insert the leads, to reduce the stress on the board during insertion.
      · Fix the board with support pins or a dedicated jig before insertion.
      · Support below the board so that the board does not bend. When using multiple support pins on the board,
        periodically confirm that there is no difference in the height of each support pin.

Component with Leads

 2-3. Attaching/Removing Sockets
      When the board itself is a connector, the board may bend when a socket is attached or removed.
      Plan the work so that the board does not bend when a socket is attached or removed.

Socket

 2-4. Tightening Screws
      The board may be bent, when tightening screws, etc. during the attachment of the board to a shield or
      chassis. Pay attention to the following items before performing the work.
      · Plan the work to prevent the board from bending.
      · Use a torque screwdriver, to prevent over-tightening of the screws.
      · The board may bend after mounting by reflow soldering, etc. Please note, as stress may be applied
        to the chips by forcibly flattening the board when tightening the screws.

Screwdriver

■ Others

1. Under Operation of Equipment

1-1. Do not touch a capacitor directly with bare hands during operation in order to avoid the danger of an electric shock.

1-2. Do not allow the terminals of a capacitor to come in contact with any conductive objects (short-circuit).
　　　Do not expose a capacitor to a conductive liquid, inducing any acid or alkali solutions.

1-3. Confirm the environment in which the equipment will operate is under the specified conditions.
　　　Do not use the equipment under the following environments.
　　　(1) Being spattered with water or oil.
　　　(2) Being exposed to direct sunlight.
　　　(3) Being exposed to ozone, ultraviolet rays, or radiation.
　　　(4) Being exposed to toxic gas (e.g., hydrogen sulfide, sulfur dioxide, chlorine, ammonia gas etc.)
　　　(5) Any vibrations or mechanical shocks exceeding the specified limits.
　　　(6) Moisture condensing environments.

1-4. Use damp proof countermeasures if using under any conditions that can cause condensation.

2. Others

2-1. In an Emergency
　(1) If the equipment should generate smoke, fire, or smell, immediately turn off or unplug the equipment.
　　　If the equipment is not turned off or unplugged, the hazards may be worsened by supplying continuous power.
　(2) In this type of situation, do not allow face and hands to come in contact with the capacitor or burns may be caused
　　　by the capacitor's high temperature.

2-2. Disposal of waste
　When capacitors are disposed of, they must be burned or buried by an industrial waste vendor with the appropriate
　licenses.

2-3. Circuit Design
　(1) Addition of Fail Safe Function
　　　Capacitors that are cracked by dropping or bending of the board may cause deterioration of the
　　　insulation resistance, and result in a short. If the circuit being used may cause an electrical shock,
　　　smoke or fire when a capacitor is shorted, be sure to install fail-safe functions, such as a fuse,
　　　to prevent secondary accidents.
　(2) This series are not safety standard certified products.

2-4. Remarks
　Failure to follow the cautions may result, worst case, in a short circuit and smoking when the product is used.
　The above notices are for standard applications and conditions. Contact us when the products are used in special
　mounting conditions.
　Select optimum conditions for operation as they determine the reliability of the product after assembly.
　The data herein are given in typical values, not guaranteed ratings.

■ Rating

1.Operating Temperature

1. The operating temperature limit depends on the capacitor.

1-1. Do not apply temperatures exceeding the maximum operating temperature.
It is necessary to select a capacitor with a suitable rated temperature that will cover the operating temperature range.
It is also necessary to consider the temperature distribution in equipment and the seasonal temperature variable factor.

1-2. Consider the self-heating factor of the capacitor
The surface temperature of the capacitor shall not exceed the maximum operating temperature including self-heating.

2.Atmosphere Surroundings (gaseous and liquid)

1. Restriction on the operating environment of capacitors.

1-1. Capacitors, when used in the above, unsuitable, operating environments may deteriorate due to the corrosion of the terminations and the penetration of moisture into the capacitor.

1-2. The same phenomenon as the above may occur when the electrodes or terminals of the capacitor are subject to moisture condensation.

1-3. The deterioration of characteristics and insulation resistance due to the oxidization or corrosion of terminal electrodes may result in breakdown when the capacitor is exposed to corrosive or volatile gases or solvents for long periods of time.

3.Piezo-electric Phenomenon

1. When using high dielectric constant type capacitors in AC or pulse circuits, the capacitor itself vibrates at specific frequencies and noise may be generated.
Moreover, when the mechanical vibration or shock is added to capacitor, noise may occur.

muRata

■Soldering and Mounting

1.PCB Design

1. Notice for Pattern Forms

1-1. Unlike leaded components, chip components are susceptible to flexing stresses since they are mounted
   directly on the substrate.
   They are also more sensitive to mechanical and thermal stresses than leaded components.
   Excess solder fillet height can multiply these stresses and cause chip cracking.
   When designing substrates, take land patterns and dimensions into consideration to eliminate the possibility
   of excess solder fillet height.

1-2. There is a possibility of chip cracking caused by PCB expansion/contraction with heat, because stress
   on a chip is different depending on PCB material and structure.When the thermal expansion coefficient
   greatly differs between the board used for mounting and the chip,it will cause cracking of the chip due to
   the thermal expansion and contraction. When capacitors are mounted on a fluorine resin printed circuit
   board or on a single-layered glass epoxy board, it may also cause cracking of the chip for the same reason.

Pattern Forms

	Prohibited	Correct
Placing Close to Chassis	Chassis / Solder (ground) / Electrode Pattern / in section	Solder Resist / in section
Placing of Chip Components and Leaded Components	Lead Wire / in section	Solder Resist / in section
Placing of Leaded Components after Chip Component	Soldering Iron / Lead Wire / in section	Solder Resist / in section
Lateral Mounting		Solder Resist

2. Land Dimensions

2-1. Chip capacitors can be cracked due to the stress
of PCB bending , etc. if the land area is larger than
needed and has an excess amount of solder.
Please refer to the land dimensions in table 1
for reflow soldering.

Please confirm the suitable land dimension by
evaluating of the actual SET / PCB.

Table 1 Reflow Soldering Method

Series	Chip Dimension (L/W) Code	Chip(L×W)	a	b	c
GJM	02	0.4×0.2	0.16 to 0.2	0.12 to 0.18	0.2 to 0.23
GJM	03	0.6×0.3	0.2 to 0.3	0.2 to 0.35	0.2 to 0.4
GJM	15	1.0×0.5	0.3 to 0.5	0.35 to 0.45	0.4 to 0.6

(in mm)

3. Board Design
When designing the board, keep in mind that the amount of strain which occurs will increase depending on the size
and material of the board.

Relationship with amount of strain to the board thickness, length, width, etc.]

$$\varepsilon = \frac{3PL}{2Ewh^2}$$ Relationship between load and strain

ε : Strain on center of board (μst)
L : Distance between supporting points (mm)
w : Board width (mm)
h : Board thickness (mm)
E : Elastic modulus of board (N/m^2=Pa)
Y : Deflection (mm)
P : Load (N)

When the load is constant, the following relationship can be established.
· As the distance between the supporting points (L) increases,the amount of   strain also increases.
→Reduce the distance between the supporting points.
· As the elastic modulus (E) decreases, the amount of strain increases.
→Increase the elastic modulus.
· As the board width (w) decreases, the amount of strain increases.
→Increase the width of the board.
· As the board thickness (h) decreases, the amount of strain increases.
→Increase the thickness of the board.
Since the board thickness is squared, the effect on the amount of strain becomes even greater.

2.Reflow soldering

The halogen system substance and organic acid are included in solder paste, and a chip corrodes
by this kind of solder paste.
Do not use strong acid flux.
Do not use water-soluble flux.*
 (*Water-soluble flux can be defined as non-rosin type flux including wash-type flux and non-wash-type flux.)

3.Washing

1. Please evaluate the capacitor using actual cleaning equipment and conditions to confirm the quality,
   and select the solvent for cleaning.

2. Unsuitable cleaning solvent may leave residual flux or other foreign substances, causing deterioration of
   electrical characteristics and the reliability of the capacitors.

3. Select the proper cleaning conditions.

 3-1. Improper cleaning conditions (excessive or insufficient) may result in the deterioration of the performance
      of the capacitors.

4.Coating

1. A crack may be caused in the capacitor due to the stress of the thermal contraction of the resin during curing process.
   The stress is affected by the amount of resin and curing contraction. Select a resin with low curing contraction.
   The difference in the thermal expansion coefficient between a coating resin or a molding resin and the capacitor
   may cause the destruction and deterioration of the capacitor such as a crack or peeling, and lead to the deterioration
   of insulation resistance or dielectric breakdown.
   Select a resin for which the thermal expansion coefficient is as close to that of the capacitor as possible.
   A silicone resin can be used as an under-coating to buffer against the stress.

2. Select a resin that is less hygroscopic.
   Using hygroscopic resins under high humidity conditions may cause the deterioration of the insulation resistance
   of a capacitor. An epoxy resin can be used as a less hygroscopic resin.

3. The halogen system substance and organic acid are included in coating material, and a chip corrodes
   by the kind of Coating material. Do not use strong acid type.

■ Others

1.Transportation

1. The performance of a capacitor may be affected by the conditions during transportation.

 1-1. The capacitors shall be protected against excessive temperature, humidity and mechanical force during transportation.

   (1) Climatic condition
     ・low air temperature : -40℃
     ・change of temperature air/air : -25℃/+25℃
     ・low air pressure : 30 kPa
     ・change of air pressure : 6 kPa/min.

  (2) Mechanical condition
     Transportation shall be done in such a way that the boxes are not deformed and forces are not directly passed on to the inner packaging.

 1-2. Do not apply excessive vibration, shock, or pressure to the capacitor.

   (1) When excessive mechanical shock or pressure is applied to a capacitor, chipping or cracking may occur in the ceramic body of the capacitor.

   (2) When the sharp edge of an air driver, a soldering iron, tweezers, a chassis, etc. impacts strongly on the surface of the capacitor, the capacitor may crack and short-circuit.

 1-3. Do not use a capacitor to which excessive shock was applied by dropping etc.
   A capacitor dropped accidentally during processing may be damaged.

2.Characteristics Evaluation in the Actual System

1. Evaluate the capacitor in the actual system,to confirm that there is no problem with the performance and specification values in a finished product before using.

2. Since a voltage dependency and temperature dependency exists in the capacitance of high dielectric type ceramic capacitors, the capacitance may change depending on the operating conditions in the actual system.
Therefore,be sure to evaluate the various characteristics, such as the leakage current and noise absorptivity, which will affect the capacitance value of the capacitor.

3. In addition,voltages exceeding the predetermined surge may be applied to the capacitor by the inductance in the actual system. Evaluate the surge resistance in the actual system as required.

1.Please make sure that your product has been evaluated in view of your specifications with our product being mounted to your product.

2.Your are requested not to use our product deviating from this product specification.

3.We consider it not appropriate to include any terms and conditions with regard to the business transaction in the product specifications, drawings or other technical documents. Therefore, if your technical documents as above include such terms and conditions such as warranty clause, product liability clause, or intellectual property infringement liability clause, they will be deemed to be invalid.
