### 2.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

The midpoint is  $V_{IL} + (V_{IH} - V_{IL}) / 2$

## 2.2.5 Power consumption operating behaviors

The current parameters in the table below are derived from code executing a while(1) loop from flash, unless otherwise noted.

The IDD typical values represent the statistical mean at 25°C, and the IDD maximum values for RUN, WAIT, VLPR, and VLPW represent data collected at 125°C junction temperature unless otherwise noted. The maximum values represent characterized results equivalent to the mean plus three times the standard deviation (mean + 3 sigma).

1. This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEI clock mode).
2.  $2.0\text{ V} \leq VDD \leq 3.6\text{ V}$ .
3. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=0.
4. The resulting system clock frequencies should not exceed their maximum specified values. The DCO frequency deviation ( $\Delta f_{dco\_t}$ ) over voltage and temperature should be considered.
5. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=1.
6. The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
7. This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bits are changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
8. Excludes any oscillator currents that are also consuming power while PLL is in operation.
9. This specification was obtained using a Freescale developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary.
10. This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

### 3.8.1 DSPI switching specifications (limited voltage range)

The Deserial Serial Peripheral Interface (DSPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The tables below provide DSPI timing characteristics for classic SPI timing modes. Refer to the SPI chapter of the Reference Manual for information on the modified transfer formats used for communicating with slower peripheral devices.

**Table 33. Master mode DSPI timing (limited voltage range)**

The tables below provides DSPI timing characteristics for classic SPI timing modes. Refer to the SPI chapter of the Reference Manual for information on the modified transfer formats used for communicating with slower peripheral devices.

**Table 35. Master mode DSPI timing (full voltage range)**

Table continues on the next page...

**Table 37. I<sup>2</sup>C timing (continued)**

Characteristic	Symbol	Standard Mode		Fast Mode		Unit
		Minimum	Maximum	Minimum	Maximum	
Data hold time for I <sup>2</sup> C bus devices	t <sub>HD</sub> ; DAT	0 <sup>2</sup>	3.45 <sup>3</sup>	0 <sup>4</sup>	0.9 <sup>2</sup>	μs
Data set-up time	t <sub>SU</sub> ; DAT	250 <sup>5</sup>	—	100 <sup>3, 6</sup>	—	ns
Rise time of SDA and SCL signals	t <sub>r</sub>	—	1000	20 + 0.1C <sub>b</sub> <sup>7</sup>	300	ns
Fall time of SDA and SCL signals	t <sub>f</sub>	—	300	20 + 0.1C <sub>b</sub> <sup>6</sup>	300	ns
Set-up time for STOP condition	t <sub>SU</sub> ; STO	4	—	0.6	—	μs
Bus free time between STOP and START condition	t <sub>BUF</sub>	4.7	—	1.3	—	μs
Pulse width of spikes that must be suppressed by the input filter	t <sub>SP</sub>	N/A	N/A	0	50	ns

1. The maximum SCL Clock Frequency in Fast mode with maximum bus loading can only be achieved when using the High drive pins across the full voltage range and when using the Normal drive pins and VDD ≥ 2.7 V.
2. The master mode I<sup>2</sup>C deasserts ACK of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
3. The maximum t<sub>HD</sub>; DAT must be met only if the device does not stretch the LOW period (t<sub>LOW</sub>) of the SCL signal.
4. Input signal Slew = 10 ns and Output Load = 50 pF
5. Set-up time in slave-transmitter mode is 1 IPBus clock period, if the TX FIFO is empty.
6. A Fast mode I<sup>2</sup>C bus device can be used in a Standard mode I<sup>2</sup>C bus system, but the requirement t<sub>SU</sub>; DAT ≥ 250 ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line t<sub>rmax</sub> + t<sub>SU</sub>; DAT = 1000 + 250 = 1250 ns (according to the Standard mode I<sup>2</sup>C bus specification) before the SCL line is released.
7. C<sub>b</sub> = total capacitance of the one bus line in pF.

**Table 38. I<sup>2</sup>C 1 Mbps timing**

SCL Clock Frequency	f <sub>SCL</sub>	0	1 <sup>1</sup>	MHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated.	t <sub>HD</sub> ; STA	0.26	—	μs
LOW period of the SCL clock	t <sub>LOW</sub>	0.5	—	μs
HIGH period of the SCL clock	t <sub>HIGH</sub>	0.26	—	μs
Set-up time for a repeated START condition	t <sub>SU</sub> ; STA	0.26	—	μs
Data hold time for I <sup>2</sup> C bus devices	t <sub>HD</sub> ; DAT	0	—	μs
Data set-up time	t <sub>SU</sub> ; DAT	50	—	ns
Rise time of SDA and SCL signals	t <sub>r</sub>	20 + 0.1C <sub>b</sub> <sup>2</sup>	120	ns
Fall time of SDA and SCL signals	t <sub>f</sub>	20 + 0.1C <sub>b</sub> <sup>2</sup>	120	ns
Set-up time for STOP condition	t <sub>SU</sub> ; STO	0.26	—	μs
Bus free time between STOP and START condition	t <sub>BUF</sub>	0.5	—	μs
Pulse width of spikes that must be suppressed by the input filter	t <sub>SP</sub>	0	50	ns

1. The maximum SCL clock frequency of 1 Mbps can support maximum bus loading when using the High drive pins across the full voltage range.
2. C<sub>b</sub> = total capacitance of the one bus line in pF.

# 7 Terminology and guidelines

## 7.1 Definitions

Key terms are defined in the following table:

Term	Definition
Rating	<p>A minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:</p> <ul style="list-style-type: none"> <li>• <i>Operating ratings</i> apply during operation of the chip.</li> <li>• <i>Handling ratings</i> apply when the chip is not powered.</li> </ul> <p><b>NOTE:</b> The likelihood of permanent chip failure increases rapidly as soon as a characteristic begins to exceed one of its operating ratings.</p>
Operating requirement	A specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip
Operating behavior	A specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions
Typical value	<p>A specified value for a technical characteristic that:</p> <ul style="list-style-type: none"> <li>• Lies within the range of values specified by the operating behavior</li> <li>• Is representative of that characteristic during operation when you meet the <a href="#">typical-value conditions</a> or other specified conditions</li> </ul> <p><b>NOTE:</b> Typical values are provided as design guidelines and are neither tested nor guaranteed.</p>

## 7.2 Examples

Operating rating:

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	-0.3	1.2	V

Operating requirement:

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	0.9	1.1	V

Operating behavior that includes a typical value:

Symbol	Description	Min.	Typ.	Max.	Unit
I <sub>WP</sub>	Digital I/O weak pullup/pulldown current	10	70	130	μA

## 7.3 Typical-value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

Symbol	Description	Value	Unit
T <sub>A</sub>	Ambient temperature	25	°C
V <sub>DD</sub>	Supply voltage	3.3	V

## 7.4 Relationship between ratings and operating requirements

## 7.5 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip's ratings.
- During normal operation, don't exceed any of the chip's operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.
