Rev. 1.1 — 10 June 2021

Product data sheet

1 General description

PTN3944 is a high-performance multi-channel (x4) linear equalizer that is optimized for PCIe 4.0, UPI, and similar high-speed interfaces.

PTN3944 addresses high-speed signal quality enhancement requirements for implementation of PCIe and UPI interfaces[1].

The device provides programmable linear equalization, output swing linearity control by pin strapping or I²C control to improve signal integrity and enable channel extension by reducing Inter-Symbol Interference (ISI). The equalizer supports use across a variety of channel conditions.

PTN3944 is powered from a 1.8 V supply. It is available in a small high performance HWFLGA36 package.

2 Features

- Supports PCIe Gen1 (2.5 Gbps) x4, Gen2 (5 Gbps) x4, Gen3 (8 Gbps) x4, and Gen4 (16 Gbps) x4
 - Peaking gain up to 18.3 dB at 8 GHz
 - Output swing linearity control: 500 mV_{ppd} to 950 mV_{ppd}
 - Flat gain of +0.7 dB or -0.7 dB
- Configurable via I²C interface (supports 16 slave addresses)
- Supports maximum voltage limit (V_{voltage_jump}) to align to the latest system platform capabilities
- Integrated termination resistors provide impedance matching on both transmit and receive sides
- RX equalizers on all high-speed channels to compensate for signal attenuation
- Good linearity over the frequency band (DC to Nyquist Frequency) and input voltage dynamic range
- Differential input/output return loss performance < -15 dB up to 8 GHz
- Flow-through pin-out to ease PCB layout and minimize crosstalk effects
 - Very low crosstalk: DDNEXT < -60 dB up to 8 GHz
 - Very low crosstalk: DDFEXT < -50 dB up to 8 GHz
- Low active current consumption for output swing linearity control of 950 $\mathrm{mV}_{\mathrm{ppd}}$
 - Single channel: 62 mA (typ)
 - Two channels: 125 mA (typ)
 - Four channels: 250 mA (typ)
- Power Supply 1.7 V to 1.9 V
- Small high performance HWFLGA36 package
- ESD HBM 1.5 kV, CDM 1 kV
- Operating temperature range -20 °C to +85 °C

3 Applications

- Servers
- Data centers
- AI/ML hardware accelerators
- Hub or dock devices
- Edge mobile computing devices

7 Functional description

7.1 PCIe operation

PTN3944 supports PCIe speeds at 2.5 Gbps, 5 Gbps, 8 Gbps, and 16 Gbps with receiver equalization and linearity control. The receive equalization gain and linearity level are configured either via I^2C register settings or pin strapping (LCTL[3:1], FG[2:1]).

 Active state wherein device is fully operational. In this state, PCIe connection exists and the Receive Termination remains active. PTN3944 supports entering into Deep standby state using an I²C register write.

PTN3944 uses lane count information for configuring the transmitters and receivers. It is possible that only a subset of lanes gets selected and remaining lanes are not active. Depending on the number of lanes selected, PTN3944 is configured to operate with the selected lane count thereby saving power consumption on unused lanes. This can be configured via I^2C .

7.2 Linear equalizer control

PTN3944 allows for programming of equalization and linearity levels on a per channel basis. Peaking gain is referenced to the maximum data rate (or Nyquist channel) in that channel. Linearity (Output swing control) is set based on selected input source signal amplitude, Tx preset, and expected channel attenuation.

7.2.1 Power-on operational mode

After Power On Reset (POR) initialization, the device goes into PCIe mode of operation.

7.2.2 Channel settings

PTN3944 can be configured via GPIO or using the I^2C interface. The I^2C interface allows many more settings to be configured. The ternary channel condition or GPIO inputs LCTL1, LCTL2, LCTL3, FG1 and FG2 are enabled and sampled at POR. The detected values from these ternary inputs are then used to initialize the I^2C registers. After entry into I^2C mode, changes to the ternary channel conditions are ignored and subsequent writes of I^2C values overwrite the sampled ternary input values. Once the ternary inputs have been sampled during Mode detection, there is no mechanism to reinitialize the I^2C registers to the sampled values except an I^2C write. When a software reset is issued, I^2C register values get reset to the stored value of the ternary inputs sampled at power-up.

PTN3944

Multi-channel PCle 4.0 linear equalizer

Table 4 and Table 5 will be expanded to cover gain values at different link rates of PCIe.

Table 4. LCTL[2:1] Channel configurations: Flat gain setting of 0.7 dB (typical)

7.2.3 I²C configurability

PTN3944 has an I^2C register interface that enables system integrator to program register settings suitable as per application needs. After power on reset, the device reads the ADDR1 and ADDR2 pins for determining the I^2C Slave Address. PTN3944 provides up to eight I^2C Slave address combinations based on Quaternary (ADDR1) and Binary (ADDR2) pin settings, and they are summarized in <u>Table 8</u>.

ADDR4	ADDR3	ADDR2	ADDR1	7-Bit I ² C Slave	Address (Hex)
Pin state	Pin state	Pin state	Pin state	Address	
LOW	LOW	LOW	Connected to 1.8 V directly	0100011	0x23

 Table 8. I²C slave address options...continued

[1] Reserved I²C address, not recommended for use.

7.2.4 I²C registers

The system integrator must program the registers of the device for proper operation. Further, it is expected that the system integrator performs I^2C configuration after poweron and before data transport is initiated over the link. If such an operation is attempted during normal operation, the device may not behave as specified.

Register offset	Register name	Bits	POR default value	Description

PTN3944 Product data sheet

7.2.5 I²C read/write operations

PTN3944 supports programming of the registers through the I²C interface. Reading/ writing the registers must be done according to protocols defined in UM10204[2].

PTN3944 supports programming of the registers through the I²C interface. Reading/ writing the registers must be done according to the following sequences.

The read sequence contains two phases:

- · Command phase
- Data phase

7.2.5.1 Single byte register reads/writes

The command phase is an I^2C write to PTN3944 that contains a single data byte. The LS bit indicates if the command that is being executed will read or write data from/to the device. The other 7 bits are the device slave address. The single data byte followed is the register offset that is used to indicate which register address is being accessed (read or written). The data phase is a second I^2C transaction that starts with 7-bit slave address, with LS bit set to 1 indicating a read operation, followed by an 8-bit data read back from the device register address.

			R/W(1)			
Command phase	START	7 bits slave address	0	ACK	8-bit offset	ACK	STOP
Data phase	START	7 bits slave address	1	ACK	bits 7:0 of the register data	NACK	STOP
	driven by	master					
driven by slave aaa-027399							
(1) R/W = read/write bit. 0b = I ² C write; 1b = I ² C read							
Figure 4. I ² C read sequence							

The write sequence starts with 7-bit slave address, with LS bit set to 0 indicating a write access. The next byte is the register offset that is used to indicate which device register address is being written to. The last byte is the 8-bit register data that will be written to the device register address.

PTN3944

NXP Semiconductors

PTN3944

Multi-channel PCle 4.0 linear equalizer

7.2.5.2 Multi-byte register reads/writes

Reading one or more registers

The slave recognizes the following procedure as a request to read one or more registers:

- 1. Master asserts START condition or repeated-START condition
- 2. Master addresses PTN3944's slave address with R/W bit set as "Write"
- 3. Slave acknowledges the request by asserting ACK
- 4. Master writes the desired starting register address
- 5. Slave acknowledges the register address with ACK, even if the register address is not part of the defined register map
- 6. Master issues a repeated-START condition
- 7. Master addresses PTN3944's slave address with R/W bit set as "Read"
- 8. In the following clock pulses, the slave clocks out the value of the requested register
- 9. If master wishes to read the next consecutive register, it issues an ACK and then provides another set of clock pulses, whereby the slave supplies the value of the next register. As long as the master continues to issue ACK and supplies additional clock pulses, the slave continues to supply the value of consecutive registers. If the master attempts to read consecutive registers that do not exist in the defined register space the slave returns undefined data value of 0xFF
- 10. When the master does not wish to read additional consecutive registers, it supplies a NACK in response to the final register value it wishes to read and then issues a STOP or repeated-START condition.

Figure 6 provides an illustrative example where the master chooses to read from two consecutive registers starting with register "R".

Figure 6. Reading one or more consecutive registers

Writing one or more registers

The slave recognizes the following procedure as a request to write to one or more registers.

- 1. Master asserts START condition or repeated-START condition
- 2. Master addresses PTN3944's slave address with R/W bit set as "Write"
- 3. Slave acknowledges the request by asserting ACK
- 4. Master writes the desired starting register address
- 5. Slave acknowledges the register address with ACK, even if register address is not part of the defined register map
- 6. Master writes the data for that register address. Slave updates the value of that register once all 8 bits of data have been written
- 7. Slave acknowledges the data with ACK
- 8. If the master wishes to write to the next consecutive register address, it supplies another data byte, which the slave ACKs. The master continues writing data bytes for consecutive registers. If the master writes to more consecutive registers than exist in the register map, the slave discards the extra data bytes, but ACKs each byte. When the master finishes writing the desired register(s), it issues either a STOP condition or a repeated-START condition

<u>Figure 7</u> provides an illustrative example where the master chooses to write to three consecutive registers starting with register "R".

8 Limiting values

Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

In accordance with the Absolute Maximum Rating System (IEC 60134).

17 Legal information

17.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

17.2 Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

17.3 Disclaimers

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without

notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Product data sheet

Multi-channel PCIe 4.0 linear equalizer

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications. In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such autometr's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security - Customer understands that all NXP products may be subject to unidentified or documented vulnerabilities. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately. Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.
