LV5012MD

Bi-CMOS LSI

LED Driver IC

Overview

LV5012MD is a High Voltage LED drive controller which drives LED current with external MOS FET. LV5012MD is realized a simple LED circuit with a few external parts and reduce circuit board space.

It corresponds to various dimming controls including the TRIAC dimming control without flickering. LV5012MD is realized high efficiency due to low operation current.

Function

- High Voltage LED Controller
- Various Dimming Control
 - TRIAC & Analog Input & PWM Input
- Fixed Switching Frequency [70 kHz]
- Multiple Internal Reference Voltage
 - Auto Level Control Output & 0.45V & 0.1V
- Short Protection Circuit – [latch off]
- Over Voltage Protection – [auto recovery circuit]
- 2Staged Thermal Protection– [auto recovery circuit]
- External Thermal Protection Adopted
- Built-in TRIAC Stabilized function.

MFP14S(225mil)

ORDERING INFORMATION

See detailed ordering and shipping information on page 16 of this data sheet.

Specifications

Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	unit
High Voltage Input	HV_abs		-0.3 to 500	V
VIN pin	VINmax		-0.3 to 40	V
ENB, CS, ACS, REF_OUT, ALC_C, REF_IN			-0.3 to 7	V
OUT Pin	Vout_abs		-0.3 to 40	V
DML Pin OFF	VDL_OFF_abs	ACS=2.0V	500	V
DML Pin ON	VDL_ON_abs	ACS=0.7V, TRC=1.0V	55	V
Allowable power dissipation	Pd max	With specified board *1	0.95	W
Junction temperature	Tj		150	°C
Operating Junction temperature	Topj		-30 to +125	°C
Storage temperature	Tstg		-40 to +150	°C

*1: Specified board = 64mm×24mm×1.2mm, glass epoxy board

Caution 1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded.
Please contact us for the further details.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	unit
Input voltage	VIN		8.5 to 24	V

Electrical Characteristics at Ta = 25°C, VIN = 12V, unless otherwise specified.

Pin Assignment

Pin Function

No	Pin Symbol	Pin description
1	HV	Please connect about 10k Ω between this pin and the rectified AC voltage. Thereby HV regulator for IC startups operates.
2	DML	This pin is Drain of internal bleeder MOSFET. This pin is used in TRIAC dimming applications for TRIAC stabilization. Please connect the resistor "Rbl" between this pin and the rectified AC voltage. If ACS pin is below 0.85V, the internal bleeder MOS is turned on and bleeder current flows. Please set "Rbl" so that the voltage of DML pin does not exceed 55V when the bleeder MOS is turned on. [If this function not used, do not connect.]
3	NC	No connect pin
4	GND	GND pin.
5	ENB	Switching Operation ON/OFF pin. If the input of this pin is above 2V, OUT pin is fixed Low. If the input of this pin is below 1.8V, normal operation is started. Connect it to GND when unused.
6	ACS	This pin senses the rectified AC voltage for TRIAC dimming. If the voltage of this pin is below 0.85V, the internal bleeder MOS is turned on and bleeder current flows. If the voltage of this pin is above 1.7V, LV5012MD recognizes "TRIAC ON". If the voltage of this pin is below 1.3V, LV5012MD recognizes "TRIAC OFF". [If this function not used, please connect to REF_OUT pin.]
7	REF_OUT	Reference Voltage (3.0V) output pin.
8	ALC_C	This pin is used for Auto Level Control (ALC) function. Please connect a capacitor of about 0.1 μ F to GND. Thereby ALC_C pin can output the smoothing value of REF_IN pin voltage.
9	TRC	Please connect a capacitor about 1 μ F to GND, and a resistor about 4.7M Ω to VIN. If this pin is below 0.05V, the operation is stopped and VIN current is less than 250 μ A (typ). If this pin is above 0.1V, the operation is started.
10	REF_IN	This pin senses the rectified AC voltage for the ALC function.
11	CS	Current sense pin. When CS pin voltage exceeds the reference, the power MOSFET is turned off. (The details of the reference are described in following "Functional description".) If this pin voltage exceeds 1.9V, LV5012MD stops switching.
12	VIN	Power supply pin. Operation : VIN > UVLOON(9V) Stop : VIN < UVLOOFF(7.3V) Switching Stop : VIN > VINOVP(27V) Pull down to GND : VIN > 28V
13	GND	GND pin.
14	OUT	The external power MOSFET is driven by this pin. Please connect to MOSFET gate.

Functional description

LV5012MD is an LED driver IC that operates directly from the rectified AC voltage. LV5012MD controls brightness of the LED by controlling a peak current of the MOSFET.

1. Start up function

LV5012MD has a high voltage regulator built-in for self-supplying from the rectified AC voltage. It outputs 12V, and thereby the circuit in the IC starts. Please connect about 10kΩ between HV pin and the rectified AC voltage to operate HV regulator normally.

2. Peak current control

LV5012MD detects the current of external MOSFET as shown in the following diagram. The current that flows into MOSFET is a triangular wave shown in the diagram. The current peak value is determined by the relationship between the internal reference level and CS voltage. This relationship makes Power Factor Correction (PFC). CS voltage is used by internal comparator to compare to the reference level. And OUT pin outputs the signal for MOSFET control. LV5012MD controls the peak value of MOSFET current.

Here, the reference level is lower value of either “ALC_out” or “VREF(0.45V)”. (“ALC_out” is described in “3. Auto Level Control function”.)

R1,R2 : External resistor for REF_IN pin setting

Rcs : External resistor for current sense

M1 : External Power MOSFET

The peak value of MOSFET current (I_{pk}) is determined by :

$$\text{In the case of "ALC_out < VREF(0.45V)" } \rightarrow I_{pk} = \frac{ALC_out}{R_{cs}}$$

$$\text{In the case of "ALC_out > VREF(0.45V)" } \rightarrow I_{pk} = \frac{0.45V}{R_{cs}}$$

3. Auto Level Control (ALC) function

Auto Level Control (ALC) function makes the sine wave reference voltage which doesn't depend on AC voltage. This function realizes both lower total harmonic distortion and good line regulation. ALC function is realized by calculation shown in the following diagram.

Sine wave is inputted into REF_IN pin. And ALC_C pin is the smoothing value of REF_IN pin voltage. The ALC_C pin voltage is compared with internal reference 0.5V by the "Larger Selection". If the value of ALC_C pin voltage is more than 0.5V, the "Larger Selection" outputs ALC_C voltage, otherwise outputs 0.5V. And the "Divider" divides the value of REF_IN pin voltage by the "Larger Selection" output. If the "Larger Selection" output is ALC_C voltage, the output of "Divider" is AC voltage-independent sine wave. The "Multiplier" adjusts amplitude to 0.5V peak sine wave.

- R1, R2 setting

Please set R1, R2 so that the voltage peak of the REF_IN pin is around 1.1V to 1.9V.

e.g. Vac=230V → R1=680kΩ, R2=2.7kΩ

$$\text{REF_IN peak} = (230\text{V} \times \sqrt{2}) \times 2.7\text{k} / (680\text{k} + 2.7\text{k}) = 1.286\text{V}$$

- C1 setting

Please connect capacitor of about 0.1μF to an ALC_C pin.

4. Function for TRIAC dimming applications

LV5012MD contains the function for TRIAC dimming. This function is operated by setting ACS pin and DML pin.

4-1. TRIAC ON/OFF detection function

If ACS pin voltage is above 1.7V (internal fixed voltage), LV5012MD recognize "TRIAC ON". If ACS pin voltage is below 1.3V (internal fixed voltage), LV5012MD recognize "TRIAC OFF".

The peak value of MOSFET current is controlled by the following reference voltage level.

- During TRIAC ON (ACS > 1.7V)

The reference voltage level is lower value of either "ALC_out" or "VREF(0.45V)".

- During TRIAC OFF (ACS < 1.3V)

The reference voltage level is internal fixed 0.1V.

4-2. Bleeder current circuit

When ACS pin voltage is below 0.85V (internal fixed voltage), the built-in MOSFET for bleeder current is turned on and the bleeder current flows.

The following shows a diagram of TRIAC Dimming.

R1,R2 : External resistor for REF_IN pin setting
R3,R4 : External resistor for ACS pin setting
Rbl : External resistor for bleeder current
Rcs : External resistor for current sense
Rbl : External resistor for bleeder current
M1 : External Power MOSFET
M2 : Internal MOSFET for bleeder current

The peak value of MOSFET current (I_{pk}) is determined below

- During TRIAC ON ($ACS > 1.7V$)

$$\text{In the case of "ALC_out < VREF(0.45V)" } \rightarrow I_{pk} = \frac{ALC_out}{R_{cs}}$$

$$\text{In the case of "ALC_out > VREF(0.45V)" } \rightarrow I_{pk} = \frac{0.45V}{R_{cs}}$$

- During TRIAC OFF ($ACS < 1.3V$)

$$I_{pk} = \frac{0.1V}{R_{cs}}$$

The TRIAC ON threshold of the rectified AC is determined below.

$$Vac_triac\ on = \frac{R3 + R4}{R4} \times 1.7V$$

The TRIAC OFF threshold of the rectified AC is determined below.

$$Vac_triac\ off = \frac{R3 + R4}{R4} \times 1.3V$$

The Bleeder operation threshold of the rectified AC is determined below.

$$Vac_bleeder = \frac{R3 + R4}{R4} \times 0.85V$$

Please set R3, R4 on the basis of these expressions according to TRIAC dimmer.

In addition, please set Rbl between the rectified AC voltage and DML pin to satisfy the following expression.

$$\left(\frac{R3 + R4}{R4} \times 0.85V \right) - (Rbl \times 0.02) < 50V$$

5. Protection function

	tilte	Outline	monitor point
1	UVLO	Under Voltage Lock Out	VIN voltage
2	OC	Over Current Protection	CS voltage
3	OVP	Over Voltage Protection	VIN voltage
4	OTP	Over Temperature Protection	PN Junction temperature

5-1. UVLO(Under Voltage Lock Out)

If VIN voltage is 7.3V or lower, then UVLO operates and the IC stops. When UVLO operates, the power supply current of the IC is about 80uA or lower. If VIN voltage is 9V or higher, then the IC starts switching operation.

5-2. OCP(Over Current Protection)

CS pin is used to sense current in primary winding of transformer via external MOSFET. This provides an additional level of protection in the event of a fault. If the voltage of the CS pin exceeds VCSOCP(1.9V typ.) (A), the internal comparator will detect the event and turn off the MOSFET. The peak switch current is calculated

$$I_{ocp(peak)} [A] = V_{CSOCP}[V] / R_{cs}[\Omega]$$

The VIN pin is pulled down to fixed level, keeping the controller latched off. The latch reset occurs when the user disconnects LED from VAC and lets the VIN falls below the VIN reset voltage, UVLOFF(7.3V typ.) (B). Switching restarts when VIN rises UVLOON(9V typ.) (C).

5-3. OVP(Over Voltage Protection)

If the voltage of VIN pin is higher than the internal reference voltage VINOVP(27V typ.), switching operation is stopped. The stopping operation is kept until the voltage of VIN is lower than VINOVP(27V typ.). If the voltage of VIN pin is lower than VINOVP(27V typ.), the switching operation is restated. Please see OVP waveform chart.

5-4. OTP(Over thermal protection)

LV5012MD has the gradually thermal protection system. If the junction temperature exceeds 140 degrees Celsius, 1st stage protection mode is started. At 1st stage protection mode, the internal reference level compared with CS pin voltage is set to 0.1V. And the LED current is restricted to low values (approximately 5%).

If the junction temperature exceeds 155 degrees Celsius, the switching operation and startup circuit are stopped. Please see OTP waveform chart.

6. PWM dimming function

ENB pin is used for PWM dimming. LED current is adjusted according to PWM pulse duty of ENB input. When PWM pulse is High(2V to 5V), the IC stops switching operation. When PWM pulse is Low(below 0.6V), the IC restarts switching. Please see the waveform chart of PWM dimming.

the outline of PWM dimming using ENB pin
