

# Low-Voltage, Dual-Supply, 2-Bit, Signal Translator with Configurable Voltage Supplies and Signal Levels and 3-State Outputs

# FXL2T245

#### **General Description**

The FXL2T245 is a configurable, dual-voltage-supply translator designed for uni-directional and bi-directional voltage translation between two logic levels. The device allows translation between voltages as high as 3.6 V to as low as 1.1 V. The A port tracks the  $V_{CCA}$  level and the B port tracks the  $V_{CCB}$  level. This allows for bi-directional voltage translation over a variety of voltage levels: 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V.

The device remains in 3-state until both  $V_{CC}$ s reach active levels, allowing either  $V_{CC}$  to be powered-up first. Internal power-down control circuits place the device in 3-state if either  $V_{CC}$  is removed.

The Transmit / Receive  $(T/\overline{R})$  input determines the direction of data flow through the device. The  $\overline{OE}$  input, when HIGH, disables both the A and B ports by placing them in a 3-state condition. The FXL2T245 is designed so control pins  $T/\overline{R}$  and  $\overline{OE}$  are supplied by  $V_{CCA}$ .

#### **Features**

- Bi-Directional Interface between any 2 Levels from 1.1 V to 3.6 V
- Fully Configurable, Inputs Track V<sub>CC</sub> Level
- Non-Preferential Power-up Sequencing; either V<sub>CC</sub> maybe Powered-up First
- Outputs Remain in 3-State until Active V<sub>CC</sub> Level is Reached
- Outputs Switch to 3-State if either V<sub>CC</sub> is at GND
- Power-Off Protection
- Control Inputs (T/R, OE) Levels are Referenced to V<sub>CCA</sub> Voltage
- Packaged in 10-Lead MicroPak (1.6 mm x 2.1 mm) Package
- ESD Protection Exceeds:
  - 4 kV HBM ESD JESD22-A114 & Mil Std 883e 3015.7)
  - 8 kV HBM I/O to GND ESD (per JESD22–A114 & Mil Std 883e 3015.7)

1

- 1 kV CDM ESD (per ESD STM 5.3)
- 200 V MM ESD (per JESD22–A115 & ESD STM5.2)

UQFN10 (MICROPAK™), 1.6 x 2.1, 0.5P CASE 523AZ

## **FUNCTIONAL DESCRIPTION**

# Power-Up / Power-Down Sequencing

Due to the chip design, the FXL2T245 translator offers the advantage of either  $V_{CC}$  being powered up first. When either  $V_{CC}$  is at 0 V, outputs are in a high-impedance state. The control inputs  $(T/\overline{R}$  and  $\overline{OE})$  are designed to track the  $V_{CCA}$  supply. A pull-up resistor tying  $\overline{OE}$  to  $V_{CCA}$  should be used to ensure that bus contention, excessive currents, or oscillations do not occur during power-up/power-down. The size of the pull-up resistor is based upon the current-sinking capability of the  $\overline{OE}$  driver.

The recommended power-up sequence is:

- 1. Apply power to either V<sub>CC</sub>.
- 2. Apply power to the  $T/\overline{R}$  input (logic HIGH for A-to-B operation; logic LOW for B-to-A operation) and to the respective data inputs (A port or B port). This may occur at the same time as step 1.
- 3. Apply power to the other  $V_{CC}$ .
- 4. Drive the  $\overline{OE}$  input LOW to enable the device.

The recommended power-down sequence is:

- 1. Drive  $\overline{OE}$  input HIGH to disable the device.
- 2. Remove power from either V<sub>CC</sub>.
- 3. Remove power from the other  $V_{CC}$ .

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

5. V<sub>CCI</sub> = the V<sub>CC</sub> associated with the data input under test.

6. V<sub>CCO</sub> = the V<sub>CC</sub> associated with the output under test.

7. Don't care = any valid logic level.

8. Reflects current per supply, V<sub>CCA</sub> or V<sub>CCB</sub>.
