Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. MID400 AC Line Monitor Logic-Out Device

Features

- Direct operation from any line voltage with the use of an external resistor.
- Externally adjustable time delay
- Externally adjustable AC voltage sensing level
- Logic level compatibility
- Safety and Regulatory Approvals:
 - UL1577, 2,500 VAC_{RMS} for 1 Minute
 - DIN-EN/IEC60747-5-5, 630 V Peak Working Insulation Voltage

Applications

- Monitoring of the AC/DC “line-down” condition
- “Closed-loop” interface between electromechanical elements such as solenoids, relay contacts, small motors, and microprocessors
- Time delay isolation switch

Description

The MID400 is an optically isolated AC line-to-logic interface device. It is packaged in an 8-lead plastic DIP. The AC line voltage is monitored by two back-to-back GaAs LED diodes in series with an external resistor. A high gain detector circuit senses the LED current and drives the output gate to a logic low condition.

The MID400 has been designed solely for the use as an AC line monitor. It is recommended for use in any AC-to-DC control application where excellent optical isolation, solid state reliability, TTL compatibility, small size, low power, and low frequency operations are required.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Applications Information

The input of the MID400 consists of two back-to-back LED diodes which will accept and convert alternating currents into light energy. An integrated photo diode-detector amplifier forms the output network. Optical coupling between input and output provides 2500 VAC_{RMS} voltage isolation. A very high current transfer ratio (defined as the ratio of the DC output current and the DC input current) is achieved through the use of high gain amplifier. The detector amplifier circuitry operates from a 5V DC supply and drives an open collector transistor output. The switching times are intentionally designed to be slow in order to enable the MID400, when used as an AC line monitor, to respond only to changes in input voltage exceeding many milliseconds. The short period of time during zero-crossing which occurs once every half cycle of the power line is completely ignored. To operate the MID400, always add a resistor, R_{IN} , in series with the input (as shown in figure 3) to limit the current to the required value. The value of the resistor can be determined by the following equation:

$$R_{IN} = \frac{V_{IN} - V_F}{I_{IN}}$$

Where,

V_{IN} (RMS) is the input voltage.

V_F is the forward voltage drop across the LED.

I_{IN} (RMS) is the desired input current required to sustain a logic "O" on the output.

Pin Description

Pin Number	Pin Name	Function
1, 3	V_{IN1}, V_{IN2}	Input terminals
2, 4	N/C	No Connect
8	V_{CC}	Supply voltage, output circuit.
7	AUX	Auxiliary terminal. Programmable capacitor input to adjust AC voltage sensing level and time delay.
6	V_O	Output terminal; open collector.
5	GND	Circuit ground potential.

Glossary

VOLTAGES

$V_{IN (ON_RMS)}$ On-State RMS Input Voltage

The RMS voltage at an input terminal for a specified input current with output conditions applied according to the product specification will cause the output switching element to be sustained in the on-state within one full cycle.

$V_{IN (OFF_RMS)}$ Off-State RMS Input Voltage

The RMS voltage at an input terminal for a specified input current with output conditions applied according to the product specification will cause the output switching element to be sustained in the off-state within one full cycle.

V_{OL}

Low-Level Output Voltage

The voltage at an output terminal for a specific output current I_{OL} , with input conditions applied according to the product specification will establish a low-level at the output.

V_{OH}

High-Level Output Voltage

The voltage at an output terminal for a specific output current I_{OH} , with input conditions applied according to the product specification will establish a high-level at the output.

V_F

LED Forward Voltage

The voltage developed across the LED when input current I_F is applied to the anode of the LED.

CURRENTS

$I_{IN (ON_RMS)}$ On-State RMS Input Current

The RMS current flowing into an input with output conditions applied according to the product specification will cause the output switching element to be sustained in the on-state within one full cycle.

$I_{IN (OFF_RMS)}$ Off-state RMS Input Current

The RMS current flowing into an input with output conditions applied according to the product specification will cause the output switching element to be sustained in the off-state within one full cycle.

I_{OH}

High-Level Output Current

The current flowing into an output with input conditions applied according to the product specification will establish high-level at the output.

I_{OL} **Low-Level Output Current**

The current flowing into an output with input conditions applied according to the product specification will establish low-level at the output.

 I_{CCL} **Supply Current, Output LOW**

The current flowing into the V_{CC} supply terminal of a circuit when the output is at a low-level voltage.

 I_{CCH} **Supply Current, Output HIGH**

The current flowing into the V_{CC} supply terminal of a circuit when the output is at a high-level voltage.

DYNAMIC CHARACTERISTICS t_{ON} **Turn-On Time**

The time between the specified reference points on the input and the output voltage waveforms with the output changing from the defined high-level to the defined low-level.

 t_{OFF} **Turn-Off time**

The time between the specified reference points on the input and the output voltage waveforms with the output changing from the defined low-level to the defined high-level.
