Features & Benefits

- ▶ **Wide 3 phase input range** for global mains voltages
- ▶ **Power boost of 120% for 2s** to support capacitive loads start-up
- ▶ **Smart Hiccup behaviour in short-circuit situation** avoids self-heating
- ▶ **Parallel mode switch** to activate load balancing behaviour
- ▶ **Two means of transient protection** increase process stability
- ▶ **Fast OVP control** protects sensitive loads
- ▶ **Very low inrush energy peak (I²t)** saves cost for input line protection
- ▶ **Screw or push-in terminals available** to serve individual connection needs
- ▶ **High efficiency and low stand-by losses contribute to an eco-friendly energy footprint**
- ▶ **Strong CC overload behaviour** secures process reliability under demanding load conditions
- ▶ **DC-OK and inhibit relay contacts** for professional integration into applications control architecture
- ▶ Designed to meet the 7 most accepted IEC safety standards
- ▶ Exceeds regulatory EMC standards on radiated emission (Class B), surge immunity and fast transients

List of abbreviations

avg.	<i>average</i>	The arithmetic average calculated from a row of values.
CC		Constant output current
chap.		Chapter
Dir.		Directive
eCap		Electrolytic capacitor
EMC		Electromagnetic Compatibility
Iac		AC input current under a particular operating condition
Iout		DC output current under a particular operating condition
Iout_boost		Max. DC output current (time limited) without a shortfall of Uset.
Iout_nom		Nominal DC output current
Iout_ol		Max. intermittent DC output current in an overload situation and a shortfall of Uset.
Iout_sc		Max. short circuit DC output current and Uout close to zero.
ITU		International Telecommunication Union
max.	<i>maximum</i>	The maximum value which a parameter can assume, or which must not be exceeded. As a precondition, none of the other technical parameters exceeds its max./min. value at the same time.
MCB		Miniature circuit breaker
min.	<i>minimum</i>	The minimum value which a parameter can assume, or must not be fallen below. As a precondition, none of the other technical parameters exceeds its max./min. value at the same time.
MTBF		Mean Time Between Failure
nom.	<i>nominal</i>	The ideal or reference value of a technical parameter which is guaranteed under STC. All nominal values in this document refer to each other and represent the general specification of the device.
OCP		Overcurrent protection
OTP		Overtemperature protection
OVP		Overvoltage protection
PELV		Protective Extra Low Voltage
Pout		Output power under a particular operating condition
Pout_boost		Max. output power (time limited) without a shortfall of Uset.
Pout_nom		Nominal output power

Reg.		Regulation
SELV		Safety Extra Low Voltage
STC		Standard test conditions (see „1. General“ on page 5)
typ.	<i>typical</i>	The typical value of a parameter is not guaranteed but can be assumed under STC. The min. or max. value must be determined during the engineering process of the end application.
Uout		DC output voltage under a particular operating condition
Uout_nom		Nominal DC output voltage
Uset		Manually set output voltage via voltage potentiometer
UVP		Undervoltage protection
Vac		AC input voltage under a particular operating condition
Vac_nom		Nominal AC input voltage
/		Separator between two values. The conditions to which the values refer can be found in the last column of the table.

Table data structure

X. Technical category

Technical parameter	Characteristic (optional)	Values	Condition (optional)
---------------------	---------------------------	--------	----------------------

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (77°F) ambient temperature and a run-in time of 5 minutes.

1. General

1.1 Handling of the product

To ensure faultless and safe operation of the products it is required to observe the specified ambient conditions for transport and storage (see "Ambient conditions" on page 9), set-up, assembly, installation, commissioning, operation and maintenance.

1.2 Protection enclosure required

The device must be installed in a protective housing or control cabinet to which only qualified personnel have access.

1.3 Humid environments

Do not operate the device in a damp environment or in an environment where condensation is likely to occur.

1.4 Switch/Circuit-breaker mounting position

A switch or circuit-breaker must be mounted near the equipment.

1.5 Observe country-specific regulations

In addition to the product documentation, the relevant country-specific regulations for the installation of the device must be observed.

1.6 Prohibited electrical/mechanical modifications

The product must not be modified in any way electrically or mechanically. Modifications can result in fatal injuries and damage to property.

1.7 Expiry of the manufacturer's warranty

The power supply is maintenance-free. Repairs can only be carried out by the manufacturer. Opening the housing voids the manufacturer's warranty.

1.8 Use of third-party products

If third-party products and components are used for power or voltage increase, buffering (AC or DC side), EMC filtering, redundancies or for DC side load protection, it must be in accordance with the TDK-Lambda product specification.

1.9 Standard test conditions

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (131°F) ambient temperature and a run-in time of 5 minutes.

1.10 Normal mounting position

In the normal mounting position, the front side of the product faces into the direction of the Y axis.

¹ Except for the ITU broadcast frequency bands 87 .. 107MHz, 174 .. 230MHz and 470 .. 790MHz, where the level shall be 3V/m.

² Exceeds the requirements of the European Low Voltage Directive 2014/35/EU

³ Except for the ITU broadcast frequency bands 47 .. 68MHz, where the level shall be 3V.

Performance level definitions:

Criterion A:

The device continues operation as intended during and after the test. The specified performance level accepts a change of ±10% on nominal output voltage and current. There is neither a violation of the performance level, nor a loss of function if the device is used as intended.

Criterion B:

The device continues operation as intended after the test. The specified performance level accepts a change of ±10% on nominal output voltage and current. There is neither a violation of the performance level, nor a loss of function if the device is used as intended. During the test a violation of the performance level is allowed.

Criterion C:

A temporary loss of function is allowed, provided the function is auto-recoverable, or can be restored by the operation of the controls.

18. Compliance & Registration

	Conformity with health, safety, and environmental protection standards for products sold within the European Economic Area (EEA).
	UKCA (UK Conformity Assessed) is the product marking that is used for certain goods being placed on the United Kingdom market.
	Registration mark to indicate products conformity to the technical regulations of the Eurasian Customs Union (Russia, Belarus, Armenia, Kazakhstan and Kyrgyzstan).
	The Waste Electrical and Electronic Equipment Directive (WEEE Directive) is the European Community Directive 2012/19/EU on collection, recycling and recovery targets for all types of electrical goods.
	The Restriction of Hazardous Substances Directive 2011/65/EU (RoHS 2) regulates the use of certain hazardous substances in electrical and electronic equipment.
	Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) is a European Union regulation that addresses the production and use of chemical substances, and their potential impacts on both human health and the environment.

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (77°F) ambient temperature and a run-in time of 5 minutes.

19. Typical use-cases

19.1 Parallel Operation

For the purpose of power increase, power supplies can be paralleled. Furthermore, a paralleling can be done for limited redundancy purposes in order to backup malfunctions occurring on the primary (AC) side of the power supplies. The following measures must be taken into account:

- ▶ Only power supplies of the same series and power rating must be paralleled
- ▶ The dip switch on the front side of the power supplies must be switched to PARALLEL
- ▶ Load wiring shall be identical in terms of length and cross section
- ▶ The output voltage of the power supplies shall be adjusted to the same value ($\pm 100\text{mV}$)
- ▶ All paralleled power supplies must be operated under the same ambient conditions
- ▶ The power supplies must not be operated under any condition which requires a power derating (e.g. altitudes above 3000mASL (9842ftASL), temperatures above $55^\circ\text{C}_{\text{amb}}$ ($131^\circ\text{F}_{\text{amb}}$), etc.)
- ▶ If more than three power supplies are paralleled, each output must be protected by a decoupling module (e.g. DRM series), MCB, diode, or fuse
- ▶ The increased installation clearances must be considered (see "Installation clearances" on page 12)

i In parallel operations the values of output load regulation, inrush currents, EMI, harmonic and leakage currents will increase.

Fig. 25: Connection scheme for paralleling n+1 power supplies

Fig. 26: Example scheme of wrong parallel wiring

Fig. 27: Example of a 480W application with limited redundancy

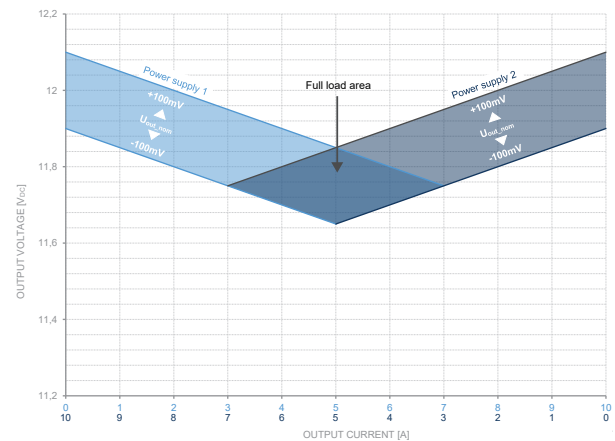

Fig. 28: Schematic of load sharing in PARALLEL mode if PSUs are adjusted to $U_{\text{out_nom}} \pm 100\text{mV}$

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (77°F) ambient temperature and a run-in time of 5 minutes.

19.2 Series operation

For the purpose of higher load voltages, power supplies can be connected in series. The following measures must be taken into account:

- ▶ The output voltage sum must not exceed 250V_{DC}
- ▶ If the output voltage sum exceeds 60V_{DC}, a safeguard against unintended touching must be considered
- ▶ Only power supplies of the same series and power rating must be connected in series
- ▶ The dip switch on the front side of the power supplies must be switched to SINGLE
- ▶ All power supplies in series must be operated under the same ambient conditions
- ▶ The power supplies must not be operated under any condition which requires a power derating (e.g. altitudes above 3000mASL (9842ftASL), temperatures above 55°C_{amb} (131°F_{amb}), etc.)
- ▶ The increased installation clearances must be considered (see “Installation clearances” on page 12)

i In series operations the values of output load regulation, inrush currents, EMI, harmonic and leakage currents will increase.

Fig. 29: Connection scheme for series operation with positive voltage level

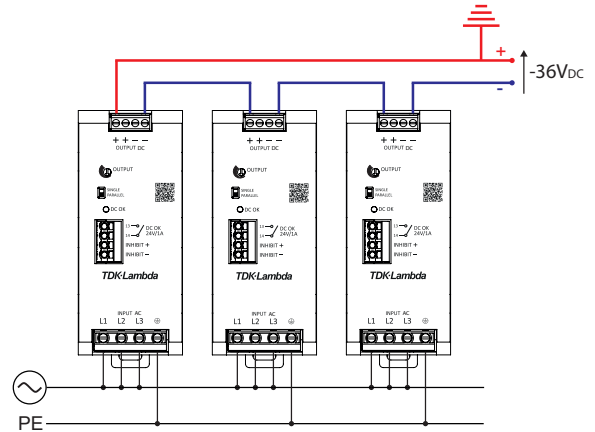

Fig. 30: Connection scheme for series operation with negative voltage level

Fig. 31: Connection scheme for series operation with centre tap

19.3 Two-phase operation

The device is capable to run continuously on two phases of a 3-phase power grid. A power derating is not required if all parameters stay within the technical product specification. In particular, all conditions associated with a power derating must be carefully considered.

Please note if running on two phases:

- ▶ Power losses will increase and can no longer be guaranteed as specified for 3-phase operation
- ▶ Hold-up times as specified for 3-phase operation can no longer be guaranteed
- ▶ The device will go into OTP mode if operating permanently at input voltages below 350V_{AC}
- ▶ The device is no more compliant with IEC/EN 61000-3-2 harmonic current limits
- ▶ Safety approvals under UL 61010-1, -2-201 and UL 62368-1 (Ed.2) are no more applicable
