

## DPD Demodulator for PA Linearization

3200 MHz to 4000 MHz

### GENERAL DESCRIPTION

This document describes the specification for the IDTF1358 Digital Pre-Distortion Demodulator for PA linearization. This series of devices is offered in 3 variants to cover common UTRA bands.

### COMPETITIVE ADVANTAGE

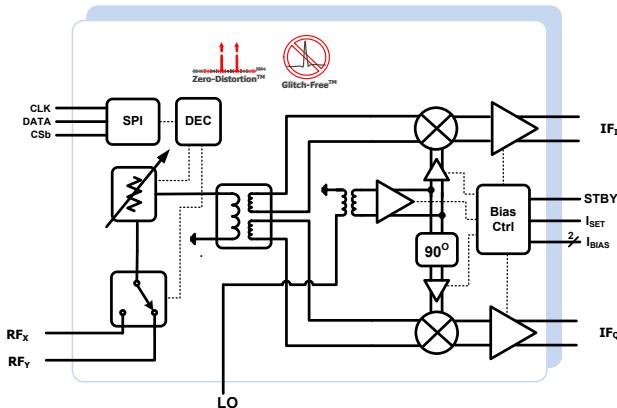

In typical basestation transmitters, digital pre-distortion is employed to improve the Transmitter performance. The signal coming out of the PA is sampled and the incoming Tx chain I&Q data is pre-distorted to counteract the distortion inherent in the PA. The PA signal is adjusted via a digital step attenuator to a lower level and then sub-sampled at an IF frequency of ~200 MHz which necessitates the need for a highly linear demodulator to downmix to quadrature IF from the Transmit frequency. By sampling IF\_I and IF\_Q independently and then digitally combining these signals, an effective doubling of the sample rate can be achieved. Any distortion in this path will degrade the performance of the DPD algorithm. By utilizing an ultra-linear demodulator w/integrated DSA such as the IDTF1358, the ACLR and/or power consumption of the full Tx system can be improved significantly.

- ✓ GlitchFree™ Technology gives better gain control
- ✓ Zero-Distortion™ eliminates the need for a second IF amplifier in the channel
- ✓ ACLR is reduced for the full channel
- ✓ Power Consumption is reduced by 40%
- ✓ Integrates 2 BPFs, 2 Baluns, and a SPDT RF switch

### FEATURES

- Wide flat performance IF BW
- Wide RF and LO BWs (~ 800 MHz)
- LO can be High or Low Side
- Ideal for Multi-Carrier Systems
- Drives ADC directly
- Ultra linear +41 dBm OIP3
- Excellent ACLR performance
- 200 Ω output impedance
- Fully integrated DPD demodulator
- Standby Mode w/Fast Recovery
- Current draw is 216 mA
- 6 x 6 mm 36 pin package

Storage Temperature Range	T <sub>st</sub>	-65	150	°C
Lead Temperature (soldering, 10s)			260	°C
ElectroStatic Discharge – HBM (JEDEC/ESDA JS-001-2012)			1000 (Class 1C)	Volts
ElectroStatic Discharge – CDM (JEDEC 22-C101F)			500 (Class C4)	Volts

Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**ESD CAUTION**

This product features proprietary protection circuitry. However, it may be damaged if subjected to high energy ESD. Please use proper ESD precautions when handling to avoid damage or loss of performance.

**PACKAGE THERMAL AND MOISTURE CHARACTERISTICS**

θ <sub>JA</sub> (Junction – Ambient)	40 °C/W
θ <sub>JC</sub> (Junction – Case) [The Case is defined as the exposed paddle]	3 °C/W
Moisture Sensitivity Rating (Per J-STD-020)	MSL1

Control Interface	SPI <sub>BIT</sub>			16		bit
Serial Clock Speed	SPI <sub>CLK</sub>			20	50	MHz

Note 1: Items in min/max columns in ***bold italics*** are Guaranteed by Test.

Note 2: Items in min/max columns that are not bold/italics are Guaranteed by Design Characterization.

Note 3: Timing measurements are measured after SPI programming is completed (data latched with CSb = HIGH).

Note 4: Gain across the entire frequency band is affected by the inclusion of the RF switch.

## DPD Demodulator for PA Linearization

**3200 MHz to 4000 MHz**

### POWER-ON SEQUENCE

The power-on sequence will ensure that the F1358 works in the default mode once powered on. If the F1358 is programmed after applying DC power, the following power-on sequence is not needed.

Note: To use power on sequence, SW\_LATCH cannot be grounded permanently.

The power-on sequence should be:

1. CSb & SW\_LATCH must be set low at power-on.
2. Once powered on, first set SW\_LATCH high, then set CSb high.
3. Proceed with normal programming.

The default state after using power-on sequence:

- Maximum attenuation
- RF\_INX selected
- Normal operation (not Standby Mode)

### REGARDING PHASE OF I & Q:

- When LO is high-side injected, IF\_I leads IF\_Q by 90 degrees
- When LO is low-side injected, IF\_Q leads IF\_I by 90 degrees

### OPERATING MODE

There are two hardware pin, STBY on Pin 14 SW\_Latch on Pin 1, which allows multiple operating modes.

**Table 1 - Operating Mode Logic Table**

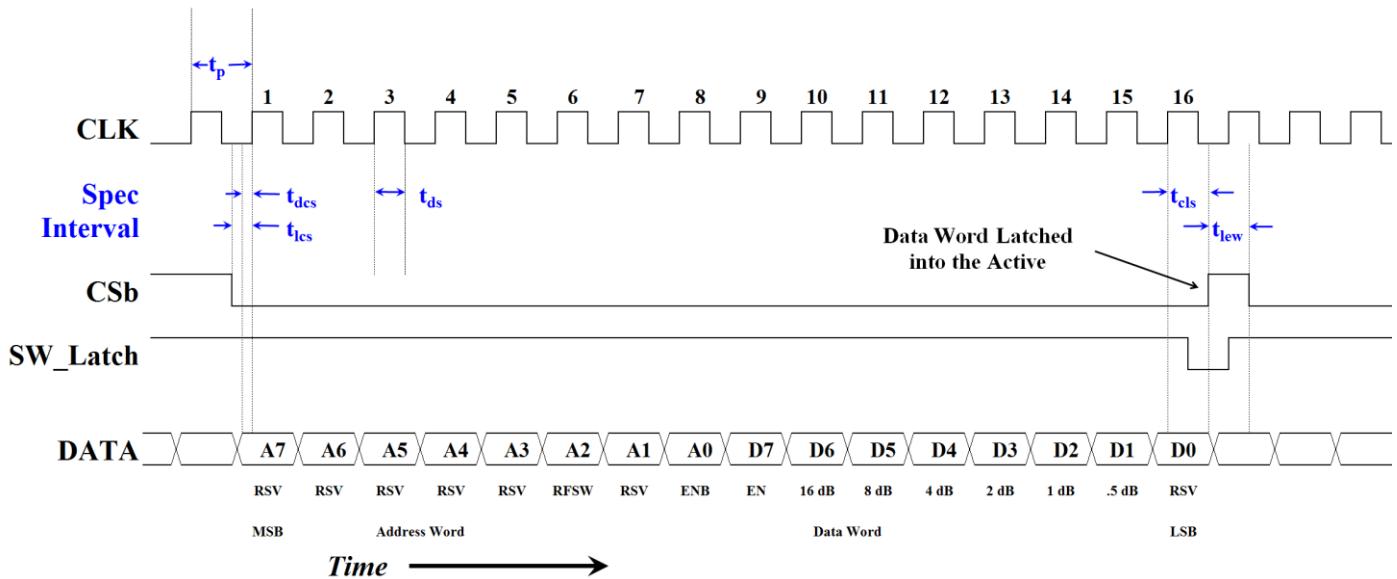

<b>STBY</b>	<b>SW_Latch</b>	<b>Mode</b>	<b>Write Access</b>	<b>Comment</b>
0	0	Operating Mode	A2,A0 Enabled, D7:D0 Enabled	RF Switch control (A2). Software Standby allowed (A0). Attenuator control (D7:D0).
0	1	Operating Mode	A2,A0 Disabled, D7:D0 Enabled	No RF Switch control. No Software Standby allowed. Attenuator control (D7:D0).
1	0	Off	A2,A0 Enabled, D7:D0 Enabled	RF Switch control (A2). Software Standby allowed (A0). Attenuator control (D7:D0). Device is in Standby mode.
1	1	Off	A2,A0 Disabled, D7:D0 Enabled	No RF Switch control. No Software Standby allowed. Attenuator control (D7:D0). Device is in Standby mode.

**DPD Demodulator for PA Linearization**
**3200 MHz to 4000 MHz**
**SERIAL CONTROL MODE**

Data is clocked in MSB first via serial mode. Serial data is formatted as a 16-bit word. The 16-bit word contains logic for switching the RF switch, 6-bit attenuator setting, and Enabling (software standby). Each word contains the following sequence:

**Table 2 - 16 Bit SPI Word Sequence**

A7	Reserved
A6	Reserved
A5	Reserved
A4	Reserved
A3	Reserved
A2	RF Switch
A1	Reserved
A0	Enable Off=0, On=1
D7	Reserved
D6	Attenuator 16 dB Control Bit
D5	Attenuator 8 dB Control Bit
D4	Attenuator 4 dB Control Bit
D3	Attenuator 2 dB Control Bit
D2	Attenuator 1 dB Control Bit
D1	Attenuator 0.5 dB Control Bit
D0	Reserved

**Figure 1 - Serial Register Timing Diagram**

**Table 3 - Serial Mode Timing Table**

<b>Interval Symbol</b>	<b>Description</b>	<b>Min Spec</b>	<b>Max Spec</b>	<b>Units</b>
$t_p$	Clock Pulse Width	<b>10</b>		ns
$t_{ds}$	Clock high pulse width	<b>5</b>		ns
$t_{cls}$	Clock to CSb Hold Time. From the rising edge of CLK pulse for D0 to Csb rising edge minus half the clock period.	<b>10</b>		ns
$t_{lew}$	CSb pulse width	<b>3</b>		ns
$t_{dcs}$	Data Setup Time - From the starting edge of Data bit to rising edge of CLK	<b>3</b>		ns
$t_{dht}$	Data Hold Time - From rising edge of CLK to falling edge of the Data bit.	<b>10</b>		ns

#### To program the serial interface:

If CSb is de-asserted (set to high), the serial interface will ignore the CLK line. Once CSb is asserted (set to low), the serial interface will recognize the CLK and any data present on DATA will be clocked into the registers with each rising CLK edge. After the 16<sup>th</sup> CLK cycle, and before the 17<sup>th</sup> CLK cycle, CSb must be de-asserted to successfully program the part with the desired bytes. If CSb is de-asserted before the 16<sup>th</sup> CLK cycle, or after the 17<sup>th</sup> CLK cycle, there is no guarantee that the correct bytes will be programmed and the user will have to re-program the interface in accordance with the aforementioned procedure.

#### SW\_LATCH programming sequence

- When SW\_LATCH is pinned high during the programming sequence, "RFSW" and "ENb" registers cannot be programmed and therefore will not toggle.
- If SW\_LATCH is pinned low during the programming sequence, the "RFSW" and "ENb" register will toggle. This can be prevented with the "Programming Sequence" below.

#### Sequence for programming registers A2, A0

1. SW\_Latch = 1; CSb = 0
2. CLK in 8- or 16-bit word, do not de-assert (pull high) CSb
3. Set SW\_LATCH = 0 while CSb = 0 remains)
4. With SW\_Latch = 0, set CSb = 1
5. Set SW\_Latch = 1
6. Program complete

#### F1358 Attenuation Table

The F1358 attenuation setting is controlled by 6 bits in the data word. The device provides for a attenuation range from 0 dB to 25.5 dB in 0.5 dB steps. A "high" or "1" bit corresponds to attenuation stepped IN, while a "low" or "0" bit corresponds to attenuation stepped OUT.

Because the first and last bits of the Data Word are not presently used by the F1358, two additional hex character pairs exist for each of those in this table. For example, data words of either H00, H80, or H01 (binary "00000000," "10000000," or 00000001) will place the F1358 in its minimum attenuation state.

## DPD Demodulator for PA Linearization

**3200 MHz to 4000 MHz**

Likewise, data words of either H66, HE6, or H67 (binary "01100110" or "11100110" or "01100111") will place the F1358 in its maximum attenuation state of 25.5 added attenuation.

**Table 4 - Attenuation Digital Word Table**

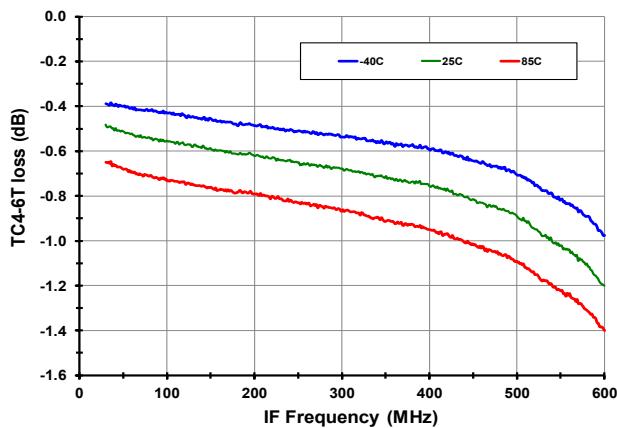

State	Attenuation (dB)	Hex	Binary D7 – D0
0	0.0	00	00000000
1	0.5	02	00000010

**PIN DIAGRAM**

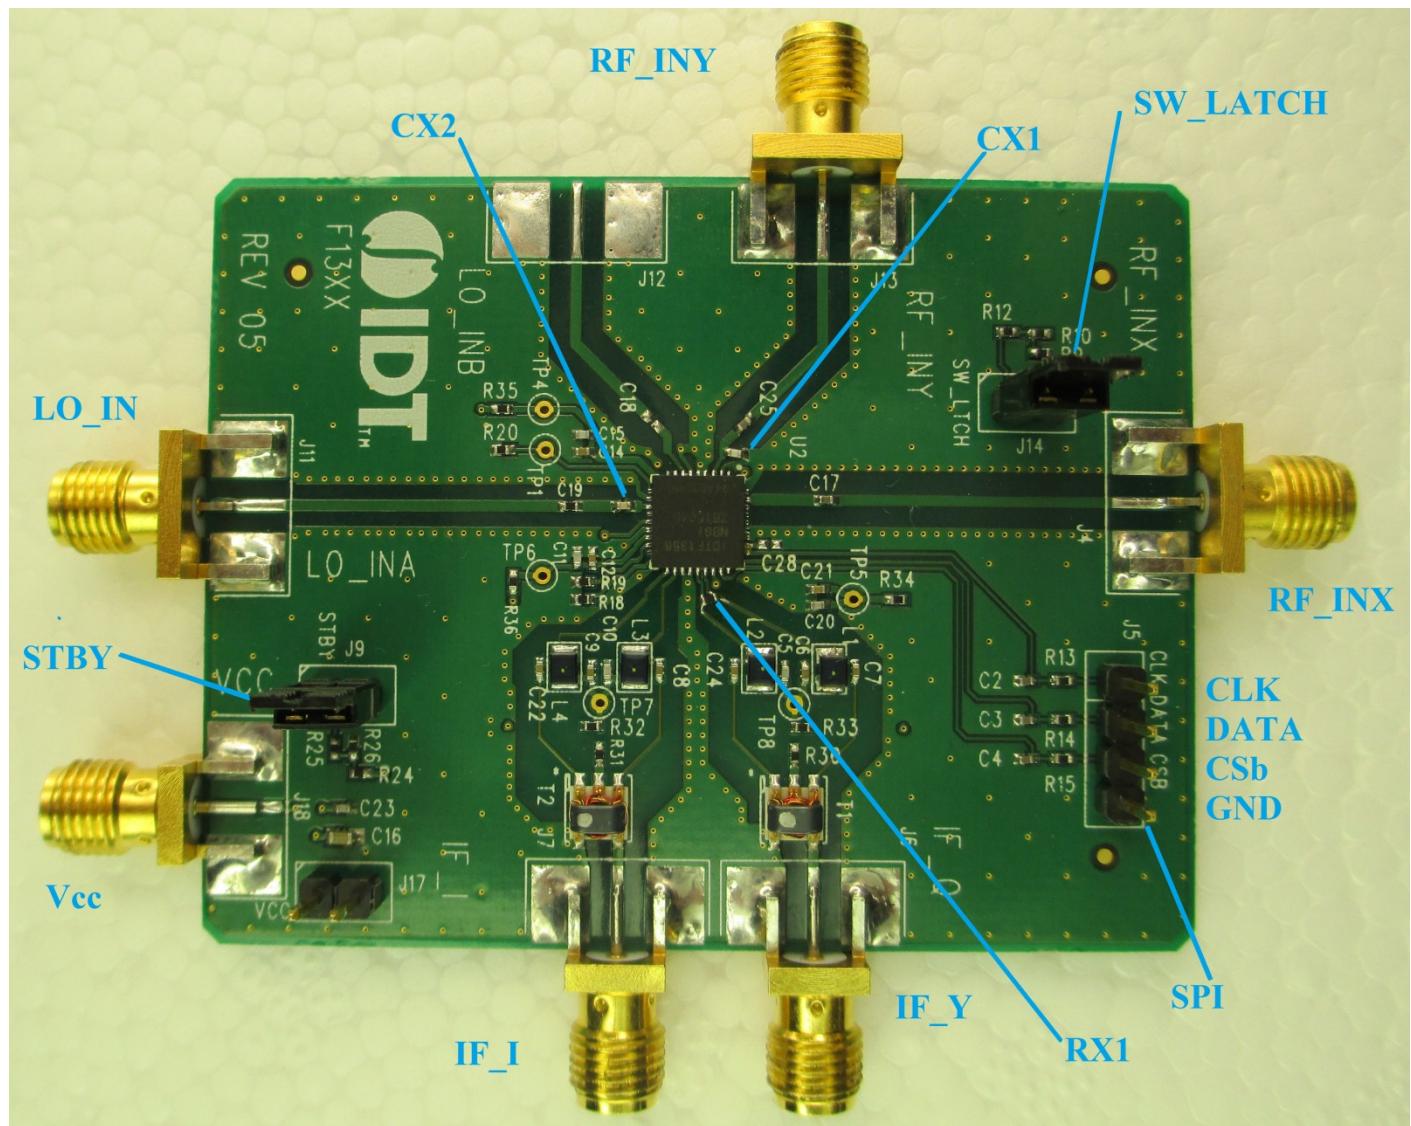

## DPD Demodulator for PA Linearization

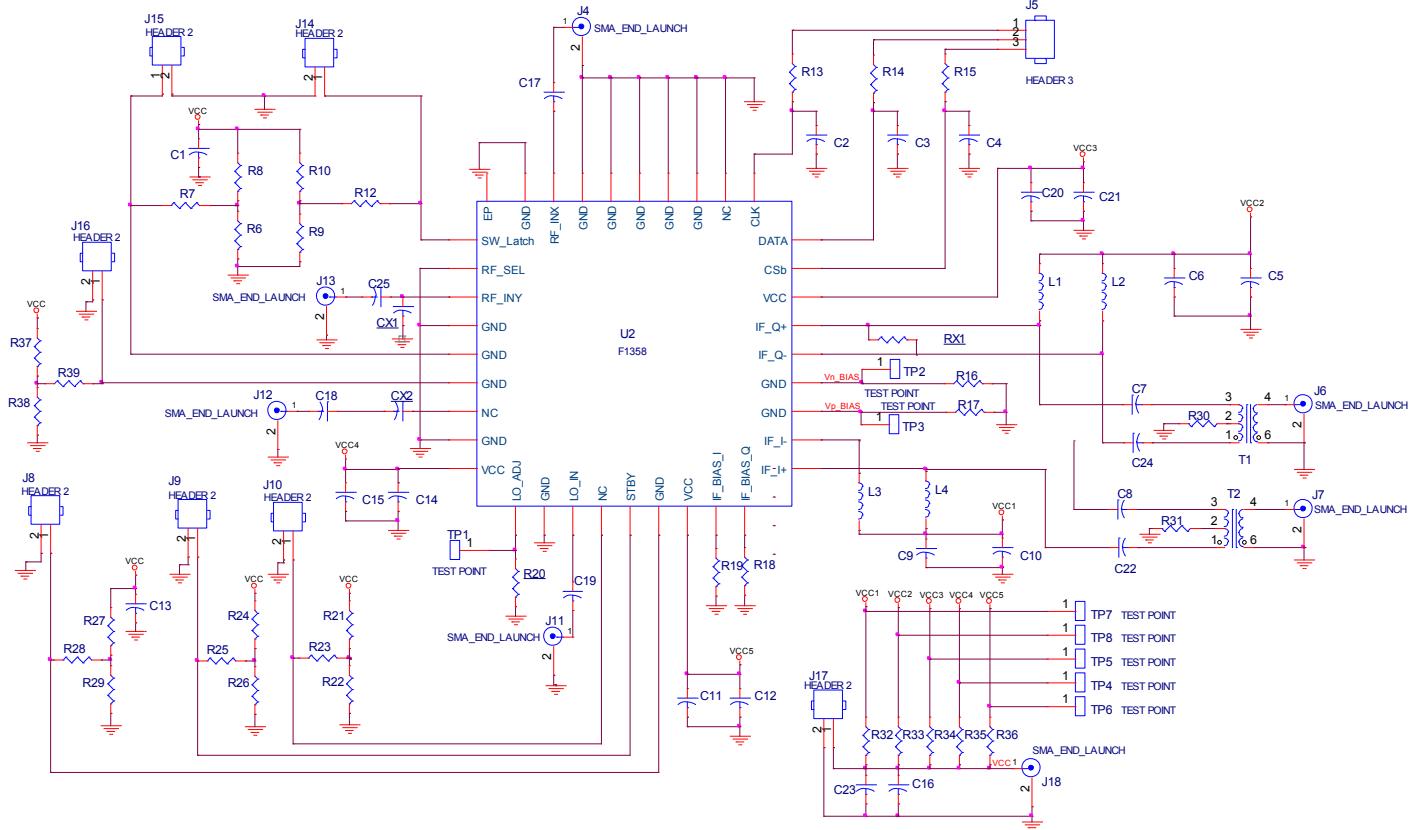

3200 MHz to 4000 MHz

## PIN DESCRIPTION

Pin	Name	Function
1	SW_LATCH	Stand-by latch. Pull Low or Ground for Normal Operation. If left floating, this input will be internally pulled high, disabling SPI writes to ENb (Standby) and RF SW bits (A0, A2).
2, 4, 5, 6, 8, 11, 15, 21, 22, 30, 31, 32, 33, 34, 36	GND	Ground these Pins.
3	RF_INY	Alternate RF Input. Separated from RF_INX by internal SP2T. AC couple to this pin. This is a reflective switch and is not internally matched to 50 ohms.
9, 16, 25	VCC	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
10	LO_ADJ	Connect the specified resistor from this pin to ground to set the LO path $I_{CC}$ . This IS a current setting resistor
12	LO_IN	LO Input. AC couple to this pin. Internally matched to 50 ohms
7, 13, 29	NC	No Connection. Not internally connected. OK to connect to Vcc. Recommended Connection is Ground
14	STBY	STBY Mode. Pull this pin high for Standby mode (30mA). Pull low or Ground for normal Operation
17, 18	IF_BIAS_I IF_BIAS_Q	Connect the specified resistor from this pin to ground to set the IF amplifier bias reference. This is NOT a current setting resistor.
19, 20	IF_I+ IF_I-	<i>In-Phase</i> Mixer Differential IF Output. Connect pull-up inductors from each of these pins to $V_{CC}$ (see the Typical Application Circuit).
23, 24	IF_Q- IF_Q+	<i>Quadrature</i> Mixer Differential IF Output. Connect pull-up inductors from each of these pins to $V_{CC}$ (see the Typical Application Circuit).
26	CSb	Chip Select Bar. The falling edge initiates a programming cycle and the rising edge latches the programmed shift register data into the active register.
27	DATA	Serial Data Input
28	CLK	Serial Clock Input
35	RF_INX	Main RF Input. Separated from RF_INY by internal SP2T. AC couple to this pin. This is a reflective switch and is not internally matched to 50 ohms.
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple via grounds are also required to achieve the noted RF performance.

**TOP MARKINGS**

## DPD Demodulator for PA Linearization

3200 MHz to 4000 MHz

## APPLICATIONS INFORMATION

F1358 has been optimized for use in high performance RF applications from 3200 MHz to 4000 MHz.

## Matching Components

For proper optimization three components were added and one was removed from our standard evaluation board.

Component	Value	Component
RX1	7.5 kΩ	
CX1	0.4 pF	This shunt capacitor is used to create a better match on the second RF input line.
CX2	0.8 pF	This series capacitor must be as close to the package as possible for the best possible match on the LO port.
C18	0 Ω	For better return loss the capacitor was moved closer to the package (CX2). This position was filled with a 0 ohm resistor to span the component gap.

## Power Supplies

All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than 1V over 20 μS (< 0.05 V/ μS). In addition, all control pins should remain at 0V (+/-0.3V) while the supply voltage ramps or while it returns to zero.

## F1358 Digital Pin Voltage &amp; Resistance Values (pins not connected)

The following table lists the resistance between various pins and ground when no DC power is applied. When the device is powered up with +5 Volts DC these same pins should have the measured voltage to ground.

Pin	Name	DC voltage (volts)	Resistance (ohms)
1	SW_LATCH	1.75	1.6M
14	STBY	5.0	50k
26	CSb	1.75	1.6M
27	DATA	1.75	1.6M
28	CLK	1.75	1.6M

**DPD Demodulator for PA Linearization**

**3200 MHz to 4000 MHz**

**I/Q Phase Error**

The standard configuration results in less than 4 degrees of I/Q Phase error with LO frequencies from 3100 to 3800 MHz. The I/Q phase error can be further improved for a given LO frequency via applications changes. Please contact [RFsupport@idt.com](mailto:RFsupport@idt.com) for help with your application.
