

AS3709

Micro-PMIC with 5 DC/DCs and 2 LDOs

General Description

The AS3709 is an ultra compact Micro-PMIC containing 5 high-efficiency, constant-frequency synchronous buck converters in addition with two universal IO LDOs are available for lower current power rails. The wide input voltage range (2.7V to 5.5V), automatic power-save mode and minimal external component requirements make the AS3709 perfect for any single Li-Ion battery-powered or fixed 3.3V/5V supply application. Typical supply current with no load is 110µA and decreases to ≤7µA in shutdown mode. An internal synchronous switch increases efficiency and eliminates the need for an external Schottky diode. The internally fixed switching frequency (2MHz, 3MHz or 4MHz) allows the use of small surface mount external components. Very low output voltages can be delivered with the internal 0.6V feedback reference voltage. The AS3709 is available in a 32-pin QFN 4x4mm package and in a very compact WL-CSP36 with 0.4mm pitch.

Ordering Information and Content Guide appear at end of datasheet.

Key Benefits & Features

The benefits and features of AS3709, Micro-PMIC with 5 DC/DCs and 2 LDOs are listed below:

Figure 1:
Added Value of Using AS3709

Benefits	Features
<ul style="list-style-type: none"> • Compact design due to small coils for IO and memory voltage generation 	<ul style="list-style-type: none"> • 5 DC/DC step down regulators (2-4MHz)
<ul style="list-style-type: none"> • Independent voltage rails for general purpose IO supplies 	<ul style="list-style-type: none"> • 2 universal IO LDOs
<ul style="list-style-type: none"> • Flexible and fast adaptation to different processors/applications 	<ul style="list-style-type: none"> • OTP programmable boot sequence
<ul style="list-style-type: none"> • Power saving control according to the processor's needs. 	<ul style="list-style-type: none"> • Stand-by function with selectable rails and programmable voltages
<ul style="list-style-type: none"> • Self-contained start-up and control for single-cell battery applications. Safety shutdown feature. 	<ul style="list-style-type: none"> • Control Interface • I²C control lines • ON key with 4s/8s emergency shut-down • POR with RESET I/O
<ul style="list-style-type: none"> • Dedicated packages for specific applications. Optimization for PCB cost or size. 	<ul style="list-style-type: none"> • 32-pin QFN (4mmx4mm), 0.4mm pitch • 36-ball WL-CSP 0.4mm pitch

Applications

The device is ideal for:

- SSDs, mobile communication devices
- Laptops and PDAs
- Ultra-low-power systems
- Medical instruments or any other space-limited application with low power-consumption requirements.

Block Diagram

The functional blocks of this device are shown below:

Absolute Maximum Ratings

Stresses beyond those listed under [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under [Electrical Characteristics](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

V_{IN}	Input Voltage Range	Pin V_{SUP}	2.7		5.5	V
I_Q	Quiescent Current	Normal operating current. With bit Low_power_on = 0; only V2_5 active		155	200	μA
$I_{LOWPOWER}$	Low-Power Quiescent Current	Normal operating current. With bit Low_power_on = 1; only V2_5 active		110		
$I_{POWEROFF}$	Shutdown Current	With bit power_off = 1; only V2_5 is active in power OFF mode. Not tested, guaranteed by design		7	20	

Electrical Characteristics: $V_{SUP} = 3.7V$, $V_{OUT} < V_{IN} - 0.5V$, $T_A = -40^{\circ}C$ to $85^{\circ}C$, typ. values @ $T_A = 25^{\circ}C$ (unless otherwise specified)

Detailed Description - Power Management Functions

Step Down DC/DC Converter

The step-down converter is a high-efficiency fixed frequency current mode regulator. By using low resistance internal PMOS and NMOS switches, efficiency up to 95% can be achieved. The fast switching frequency allows using small inductors, without increasing the current ripple. The unique feedback and regulation circuit guarantees optimum load and line regulation over the whole output voltage range, up to an output current of 1A, with an output capacitor of only 10µF. The implemented current limitation protects the DC/DC Converter and the coil during overload condition.

Figure 8:
Step Down DC/DC Converter Block Diagram

Mode Settings

To allow optimized performance in different applications, there are bit settings possible, to get the best compromise between high efficiency and low input/output ripple.

Low-Ripple, Low-Noise Operation

Low-ripple, low-noise operation can be enabled by setting bit *sd_low_noise* = 1.

In this mode there is no minimum coil current necessary before switching OFF the PMOS. As long as the load current is superior to the ripple current, the device operates in continuous mode. When the load current gets lower, the discontinuous mode is triggered. Resultant the auto-zero comparator stops the NMOS conduction to avoid load discharger and the duty cycle is reduced down to t_{MIN_ON} to keep the regulation loop stable. This results in a very low ripple and noise, but decreased efficiency at light loads, especially at low input to output voltage differences.

Only in the case the load current gets so small, that less than the minimum on time of the PMOS would be needed to keep the loop in regulation, the regulator will enter low power mode operation.

The crossover point is about 15mA for $V_{IN} = 3V$, $V_{OUT} = 1.2V$, $1\mu H$, 4MHz.

Figure 9:
DC/DC Buck Low Noise Mode

DC/DC Buck Low Noise Mode: Shows the DC/DC switching waveforms for low noise operation.

High-Efficiency Operation (Default Setting)

High-efficiency operation is enabled by setting bit *sd_low_noise* = 0.

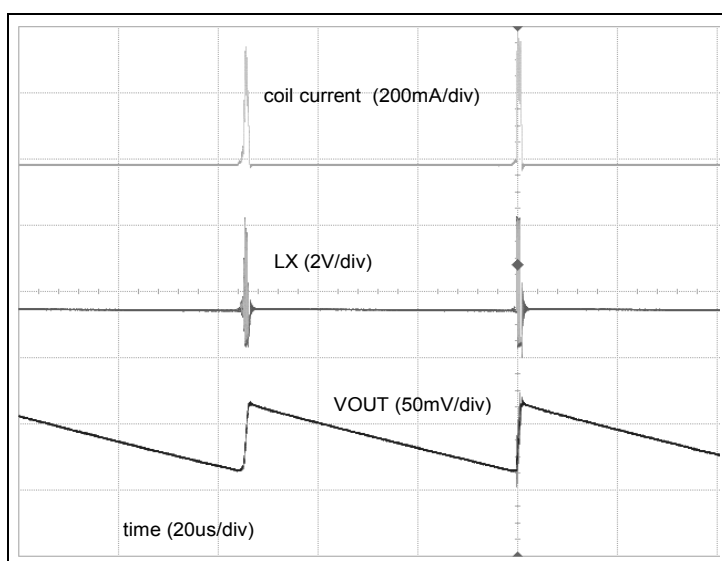

In this mode there is a minimum coil current necessary before switching OFF the PMOS. Resultant there are less pulses necessary at low output loads, and therefore the efficiency increases. As drawback, this mode increases the ripple up to a higher output current.

The crossover point to low power mode is already reached at reasonable high output currents. (e.g. @110mA for $V_{IN} = 3V$, $V_{OUT} = 1.2V$, $1\mu H$, 4MHz)

Figure 10:
DC/DC Buck High Efficiency Mode

DC/DC Buck High Efficiency Mode:

Shows the DC/DC switching waveforms for high efficiency operation

**Low Power Mode Operation (Automatically Controlled)**

As soon as the output voltage stays above the desired target value for a certain time, some internal blocks will be powered down leaving the output floating to lower the power consumption. Normal operation starts as soon as the output drops below the target value for a similar amount of time. To minimize the accuracy error some internal circuits are kept powered to assure a minimized output voltage ripple.

Two addition guard bands, based on comparators, are set at $\pm 5\%$ of the target value to react quickly on large over/undershoots by immediately turning on the output drivers without the normal time delays. This ensures a minimized ripple also in very extreme load conditions.

DVM (Dynamic Voltage Management)

To minimize the over-/undershoot during a change of the output voltage, the DVM can be enabled. With DVM the output voltage will ramp up/down with a selectable slope after the new value was written to the registers. Without DVM the slew rate of the output voltage is only determined by external components like the coil and load capacitor as well as the load current.

DVM can be selected for all step-down converters, but only for one at a time. (see *sd_dvm_select* and *dvm_time* description)

Fast Regulation Mode

This mode can be used to react faster on sudden load changes and thus minimize the over-/undershoot of the output voltage. This mode needs a 22 μ F output capacitor instead the 10 μ F one to guarantee the stability of the regulator.

The mode is enabled by setting *sd_fast* = 1.

Selectable Frequency Operation

Especially for very low load conditions, e.g. during a sleep mode of a processor, the switching frequency can be reduced to achieve a higher efficiency. The frequency can be set to 2, 3 or 4MHz and this mode is selected by setting *sd_freq* and *sd_fsel* to the appropriate values.

100% PMOS ON Mode for Low Dropout Regulation

For low input to output voltage difference the DC/DC converter can use 100% duty cycle for the PMOS transistor, which is then in LDO mode.

Step Down Converter Configuration Modes

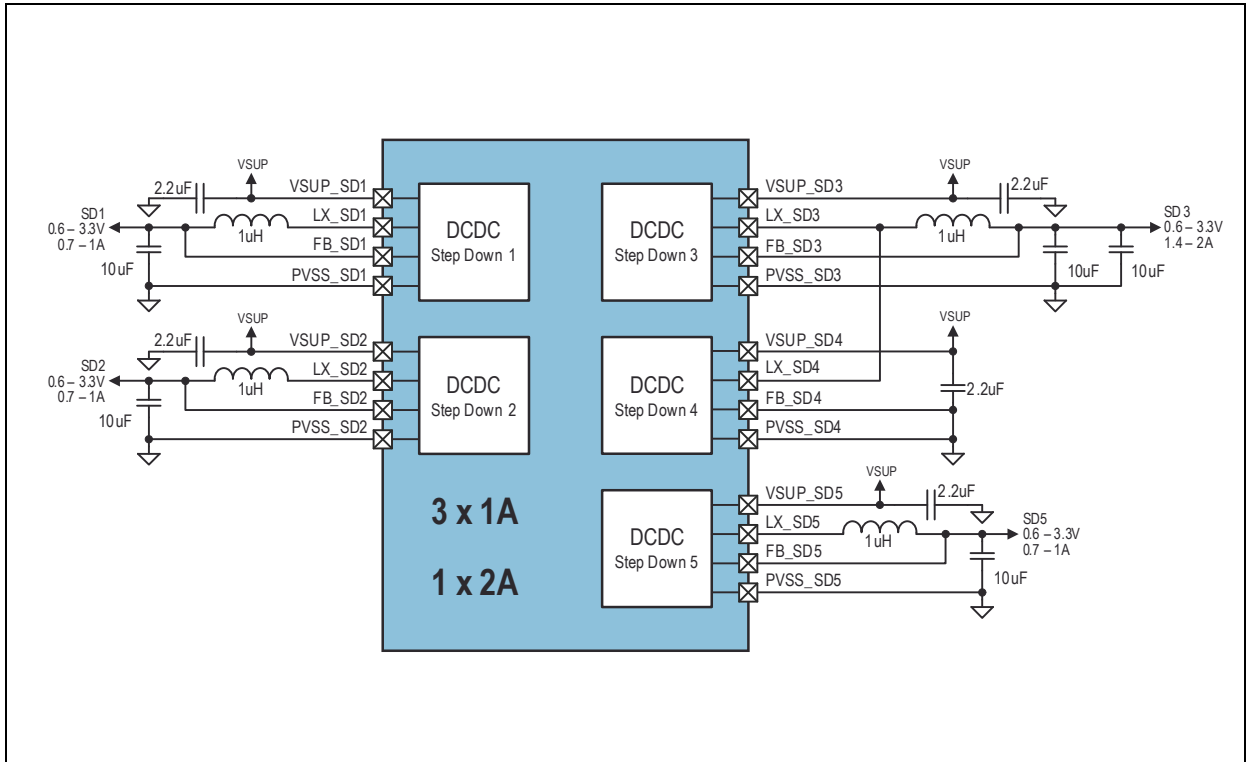

The step down dc/dc converters have two configuration modes to deliver different output currents for the applications. The operating mode is selected by setting the bit *sd2_slave*, *sd4_slave* and *sd5_slave* (the default is set by the Boot-OTP).

Figure 11:

Universal IO LDO Regulators

2 universal IO range LDOs offer a wide input (1.8V to 5.5V) as well as a wide output (0.8 to 3.3V) voltage range to be used for general purpose peripheral supply. Up to 300mA possible output currents are offered with good noise and regulation performance and very low quiescent current even suitable for stand-by power supply.

Low Power LDO V2_5 Regulator

The low power LDO V2_5 is needed to supply the chip core (analog and digital) of the device. It is designed to get the lowest possible power consumption and still offering reasonable characteristics. To ensure high PSRR and stability, a low-ESR ceramic capacitor of min. $0.7\mu\text{F}$ must be connected to the output.

Detailed Description - System Functions

Start-Up

Normal Start-Up

During a normal reset cycle (e.g. after the battery is inserted), after V2_5 is above V_{POR} and V_{SUP} is above ResVoltRise a normal startup happens:

- Configuration of DC/DCs (combined mode or separated) is read from the Boot-OTP
- Startup state machine reads out the internal Boot-OTP
- Reset-Timer is set by the Boot-OTP
- The reset is released when the Reset-Timer expires (external pin XRES)

Parameter

Figure 33:
ON Input Start-Up Condition

Symbol	Parameter	Note	Min	Typ	Max	Unit
V_{ON_IL}	ON Low Level Voltage				0.4	V
V_{ON_IH}	ON High Level Voltage		1.4			V
I_{ON_PD}	ON Pull Down Current		4	12		μ A

Figure 34:
Start-Up Flowchart

Figure 36:
Start-Up Sequence Diagram 2/3

Start-Up Sequence: This diagram shows the timing of a startup initiated by the ON-key press

Figure 37:
Start-Up Sequence Diagram 3/3

Start-Up Sequence: This diagram shows the timing of a reset command followed by a startup

Reset

XRES is a low active bi-directional pin. An external pull-up to the periphery supply has to be added. During each reset cycle the following states are controlled by the AS3709:

- Pin XRES is forced to GND
- Normal startup with programmable power-on sequence and regulator voltages
- Reset is active until the programmable reset timer (set by register bits *res_timer<2:0>*) expires
- All registers are set to their default values after power-on, except the reset control- and status-registers

RESET Reasons

Reset can be activated from 7 different sources:

- V_{POR} has been reached (V_{SUP} reached POR level)
- ResVoltFall was reached (V_{SUP} drops below ResVoltFall)
- Software forced reset
- Power off mode
- External triggered through the pin XRES
- Overtemperature
- ON-key long press

Voltage Detection

There are two types of voltage dependent resets: V_{POR} and V_{XRES} . V_{POR} monitors the voltage on V2_5 and V_{XRES} monitors the voltage on V_{SUP} . The linear regulator for V2_5 is always on and uses the voltage V_{SUP} as its source. The pin XRES is only released if V2_5 is above V_{POR} and V_{SUP} is above ResVoltRise.

Power OFF

To put the chip into ultralow power mode, write '1' into *power_off*.

The chip stays in power off mode until

- The external pin ON is pulled high
- The V_{POR} level is touched to start a complete reset cycle

The bit *power_off* is automatically cleared by this reset cycle.

During *power_off* state all circuits are shut-off except the Low Power LDO (V2_5). Thus the current consumption of AS3709 is reduced to less than 7µA. The digital part is supplied by V2_5, all other circuits are turned off in this mode, including references and oscillator. Except the reset control registers, all other registers are set to their default value after power-on.

Software Forced Reset

Writing '1' into the register bit *force_reset* immediately starts a reset cycle. The bit *force_reset* is automatically cleared by this reset.

External Triggered Reset

If the pin XRES is pulled from high to low by an external source (e.g. microprocessor or button) a reset cycle is started as well.

Overtemperature Reset

The reset cycle can be started by overtemperature conditions.

Long ON-Key Press

When applying a high level on the ON input pin for 4s/8s (depending on *on_reset_delay*) a reset is initiated. This is thought as a safety feature when the SW hangs up.

Parameter

Figure 38:
XRES Input Characteristics

Symbol	Parameter	Note	Min	Typ	Max	Unit
V_{XRES_IL}	RESET Low Level Voltage				0.4	V
V_{XRES_IH}	RESET High Level Voltage		1.4			V

Figure 39:
RESET Levels

Symbol	Parameter	Note	Min	Typ	Max	Unit
V _{POR}	Overall Power On Reset	Monitor voltage on V2_5 power on reset for all internal functions	1.5	2.0	2.3	V
V _{RES_RISE}	RESET Level for V _{SUP} Rising	Monitor voltage on V _{SUP} rising level		ResVoltRise ⁽¹⁾		V
V _{RES_FALL}	RESET Level for V _{SUP} Falling	Monitor voltage on V _{SUP} falling level		2.7		V
		if <i>SupResEn</i> = 1 only		ResVoltFall ⁽²⁾		V
V _{RES_MASK}	Mask Time for V _{XRES_fall} Duration for V _{SUP} < ResVoltFall until a reset cycle is started ⁽³⁾	<i>FastResEn</i> = 0		3		ms
		<i>FastResEn</i> = 1		4		µs

Note(s):

1. The selection of the range and level is done via OTP. It's recommended to set the ResVoltRise level 200mV above the ResVoltFall level to have a hysteresis.
2. 2.7V is the default value, other levels can be set via SW.
3. XRES signal is debounced with the specified mask time for rising- and falling slope of VSUP
4. VRES_FALL is only accepted if the reset condition is longer than VRES_MASK. This guard time is used to avoid a complete reset of the system in case of short drops of VSUP.

Figure 40:
ResVoltRise/ResVoltFall Levels

Mode	000	001	010	011	100	101	110	111
3.3V	2.7V	2.8V	2.9V	3.0V	3.1V	3.2V	3.3V	3.4V
5.0V	3.6V	3.7V	3.8V	3.9V	4.0V	4.1V	4.2V	4.4V

Note(s):

1. If bit reslevel_5V is "1", then the 5.0V mode is selected.

Stand-By

Stand-by allows shutting down a part or the complete system. Stand-by can be terminated by every possible interrupt or GPIO of the PMU. The interrupt has to be enabled and GPIO has to be configured before going to stand-by.

Figure 41:
Stand-By

State	Description
Enter via GPIO	To enter stand-by mode the following settings have to be done: <ul style="list-style-type: none"> • Enable just these IRQ sources which should lead to leave stand-by mode. • Make sure that IRQ is inactive (IRQ flags get cleared by register reading) • Set the GPIO to input (<i>gpioX_mode</i> = 0) • Set the GPIO for stand-by control (<i>gpioX_iosf</i> = 6) • Set <i>regX_select</i> to define the sequence for going into stand-by for up to 3 regulators • Set <i>regX_voltage_stby</i> if another voltage is needing during stand-by • Define which regulators should be kept powered during stand-by (<i>sdX_stby_on</i> and <i>ldoX_stby_on</i>) • Activate the selected GPIO
Enter via SW	To enter stand-by mode the following settings have to be done: <ul style="list-style-type: none"> • Enable just these IRQ sources which should lead to leave stand-by mode. • Make sure that IRQ is inactive (IRQ flags get cleared by register reading) • Define which regulators should be kept powered during stand-by (<i>sdX_stby_on</i> and <i>ldoX_stby_on</i>) • Set the delay for going into stand-by after the SW command (<i>off_delay</i>) • Set <i>standby_mode_on</i> to 1
Stand-By	V2_5 chip supply is kept ON All other regulators are switched OFF dependent on the bits <i>sdX_stby_on</i> and <i>ldoX_stby_on</i> XRES goes active (can be disabled with <i>standby_reset_disable</i>) and <i>pwr_good</i> goes inactive
Leave	The chip will come out of stand-by with <ul style="list-style-type: none"> • IRQ activation or • GPIO control (if entered via GPIO) Start-Up sequence is provided defined by the boot ROM.

Internal References

Low Power Mode

Use bit *low_power_on* to activate the Low Power Mode. In this mode the on-chip voltage reference and the temperature supervision comparators are operating in pulsed mode. This reduces the quiescent current of the AS3709 by 45µA (typ.). Because of the pulsed function some specifications are not fulfilled in this mode (e.g. increased noise), but still the full functionality is available.

Note(s): Low power mode can be controlled by the serial interface.

Figure 42:
Reference Parameter

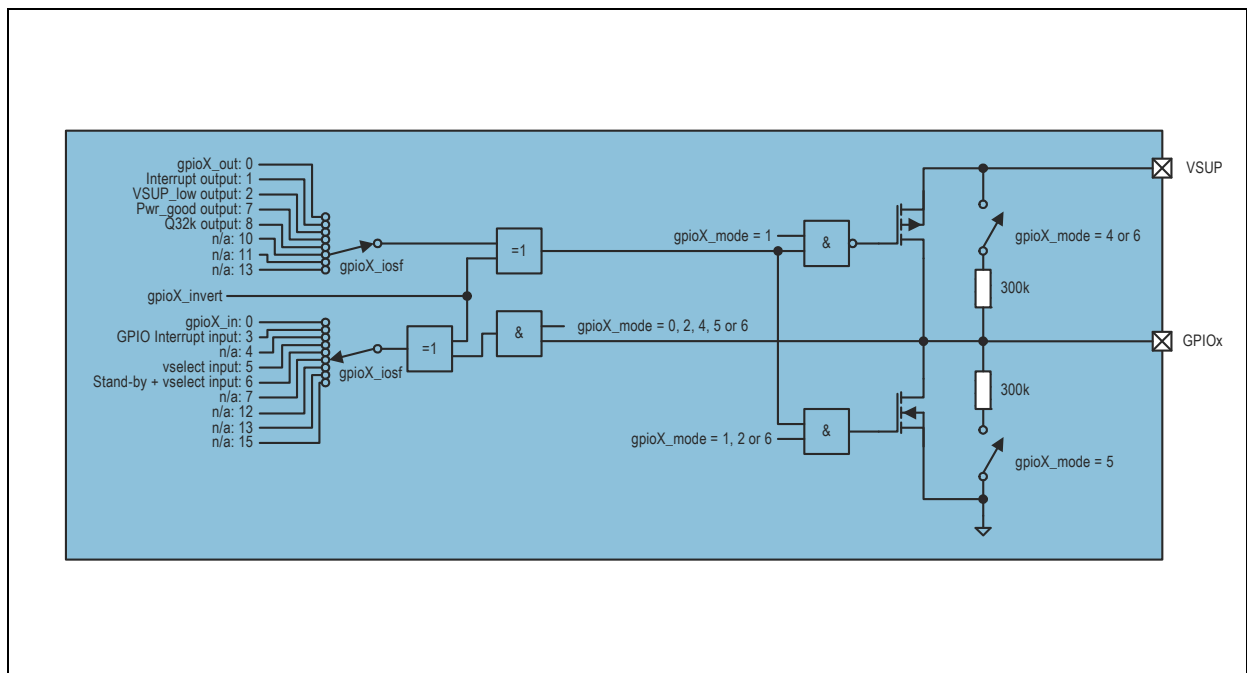

Symbol	Parameter	Note	Min	Typ	Max	Unit
f_{CLK}	Accuracy of Internal Reference Clock	Adjustable by serial interface register <code>clk_int</code>	-12	f_{CLK}	+12	%

GPIO Pins

The device contains 2 GPIO pins. Each of the pins can be configured as digital input, digital input (with pull-up or pull-down), push-pull output or open drain output (with or without pull-up). When configured as output the output source can be a register bit, or the PWM generator.

The polarity of the input and output signals can be inverted with the corresponding `gpioX_invert` bit, all further descriptions refer to normal (non-inverted) mode.

Figure 43:
GPIO Block Diagram

GPIO Block Diagram: Shows the internal structure of the IO pads

Figure 44:
GPIO Pin Characteristics

Symbol	Parameter	Note	Min	Typ	Max	Unit

$R_{pull-up}$	Pull-Up Resistance	If enabled; $V_{SUP} = 3.6V$		300		k Ω
$R_{pull-down}$	Pull-Down Resistance	If enabled; $V_{SUP} = 3.6V$		300		k Ω

GPIO Pins: Shows the key electrical parameter of the GPIO pins. $V_{SUP}=2.7$ to $5.5V$; unless otherwise mentioned.

IO Functions

Normal IO Operation

If set to input, the logic level of the signal present at the GPIOx pin can be read from *gpioX_in*. If the output mode is chosen, *gpioX_out* specifies the logic level of the GPIOx pin.

This mode is also used for the on/off control of the DC/DC and LDOs. The selection which regulator is controlled by which GPIO, is done with the *gpio_ctrl_sdX* or *gpio_ctrl_Idx* bits. The *gpioX_mode* should be set to input.

Interrupt Output

GPIOx pin logic state is derived from the interrupt signal XINT. Whenever an interrupt is present the GPIOx pin will be pulled high.

The *gpioX_mode* should be set to output.

VSUP_low Output

GPIOx pin will go high if V_{SUP} falls below *ResVoltFall* and *SupResEn* = 0.

The *gpioX_mode* should be set to output.

GPIO Interrupt Input

A falling or rising edge will set the *gpio_int* bit.

The *gpioX_mode* should be set to input.

Vselect Input

As long as the GPIOx pin is high the DC/DCs and LDOs operate with the normal register settings. If the GPIOx pin goes low the settings will change to the ones stored in *regX_voltage*. The *gpioX_mode* should be set to input.

Figure 45:
GPIO Vselect Modes

gpio1_iosf	gpio2_iosf	Vselect Mode
<> 5	<> 5	No voltage select by GPIO for regulator
<> 5	5	GPIO2 controls regulator selected by <i>reg1_select</i> and <i>reg2_select</i>
5	<> 5	GPIO1 controls regulator selected by <i>reg1_select</i> and <i>reg2_select</i>
5	5	GPIO1 controls regulator selected by <i>reg1_select</i> GPIO2 controls regulator selected by <i>reg2_select</i>

IO Functions: Shows the 4 different Vselect modes, depending on the setting of *gpioX_iosf*

Stand-By and Vselect Input

This mode is very similar to the Vselect mode described in the previous paragraph. In addition to switch between 2 register settings of 2 regulators the chip is set into stand-by mode when the GPIOx pin goes low and wakes up again when the pin is pulled high.

The *gpioX_mode* should be set to input.

GPIO1 and GPIO2 may be used to control two regulators separately.

Figure 46:
Stand-By and Vselect Modes

gpio1_iosf	gpio2_iosf	Vselect Mode	Stand-By Control
<> 6	<> 6	no voltage select by GPIO for regulator	No
<> 6	6	GPIO2 controls regulator selected by <i>reg1_select</i> and <i>reg2_select</i>	Yes
6	<> 6	GPIO1 controls regulator selected by <i>reg1_select</i> and <i>reg2_select</i>	Yes
6	6	GPIO1 controls regulator selected by <i>reg1_select</i> GPIO2 controls regulator selected by <i>reg2_select</i>	Yes

IO Functions: Shows the 4 different Vselect and Stand-By control modes, depending on the setting of *gpioX_iosf*

PWRGOOD Output

This signal will go high at the end of the start-up sequence. This can be used as a second reset signal to the processor to e.g. start oscillators.

The *gpioX_mode* should be set to output.

Supervisor

All step-down DC/DCs have an integrated over-current protection.

An overtemperature protection of the chip is also integrated which can be switched on with the serial interface signal *temp_pmc_on* (enabled by default; it is not recommended to disable the overtemperature protection).

Temperature Supervision

The chip has two signals for the serial interface: *ov_temp_110* and *ov_temp_140*.

The flag *ov_temp_110* is automatically reset if the overtemperature condition is removed, whereas *ov_temp_140* has to be reset by the serial interface with the signal *rst_ov_temp_140*. If the flag *ov_temp_140* is set, an automatic reset of the complete chip is initiated. The chip will only start-up when the temperature falls below the T110 level (including hysteresis). The flag *ov_temp_140* is not affected by this reset cycle allowing the software to detect the reason for this unexpected shutdown.

Figure 47:
Overtemperature Protection

Symbol	Parameter	Min	Typ	Max	Unit
T ₁₁₀	ov_temp_110 rising threshold	95	110	125	°C
T ₁₄₀	ov_temp_140 rising threshold	125	140	155	°C
T _{HYST}	ov_temp_110 and ov_temp_140 hysteresis		5		°C

Interrupt Generation

The interrupt controller generates an interrupt request for the host controller as soon as one or more of the bits in the *Interrupt 1...2* register are set by pulling low pin XINT (XINT has to be selected as a GPIO output function). All the interrupt sources can be enabled in the Interrupt Mask 1...2 register. The Interrupt 1...2 registers are cleared automatically after the host controller has read them. To prevent the AS3709 device from losing an interrupt event, the register that is read is captured before it is transmitted to the host controller via the serial interface. As soon as the transmission of the captured value is complete a logical AND operation with the bit wise inverted captured value is applied to the register to clear all interrupt bits that have already been transmitted. Clearing the read interrupt bits takes 2 clock cycles, a read access to the same register before the clearing process has completed will yield a value of '0'. Note that an interrupt that has been present at the previous read access will be cleared as well in case it occurs again before the clearing process has completed.

During a read access to one of the interrupt registers, the GPIO pin (GPIO output function) will be released. As soon as the transferred bits of the interrupt register have been cleared the GPIO pin (GPIO output function) will be pulled low in case a new interrupt has occurred in the meantime. By doing so, the interrupt controller will work correctly with host controllers that are edge- and level-sensitive on their interrupt request input. Multiple byte read access is recommended to avoid reading the *Interrupt 1* register over and over again in response to a new interrupt that has occurred in the same register (and thus pulling low the GPIO pin) before the Interrupt 2 register has been read.

2-Wire-Serial Control Interface

Feature List

- Fast-mode capability (max. SCL-frequency is 400 kHz)
- 7+1-bit addressing mode
- 60h x 8-bit data registers (word address 0x00 - 0x60)
- Write formats: Single-Byte-Write, Page-Write
- Read formats: Current-Address-Read, Random-Read, Sequential-Read
- SDA input delay and SCL spike filtering by integrated RC-components

I²C Protocol

Figure 48:
2-Wire Serial Symbol Definition

Symbol	Definition	RW	Note
S	Start condition after Stop	R	1 bit
Sr	Repeated Start	R	1 bit
DW	Device address for Write	R	1000 0000b (80h)
DR	Device address for Read	R	1000 0001b (81h)
WA	Word address	R	8 bit
A	Acknowledge	W	1 bit
N	No Acknowledge	R	1 bit
reg_data	Register data/write	R	8 bit
data (n)	Register data/read	W	8 bit
P	Stop condition	R	1 bit
WA++	Increment word address internally	R	During acknowledge
	AS3709 (= slave) receive data		
	AS3709 (= slave) transmits data		

I²C Write Access

Byte Write and Page Write formats are used to write data to the slave.

Figure 49:
I²C Byte Write

Figure 50:
I²C Page Write

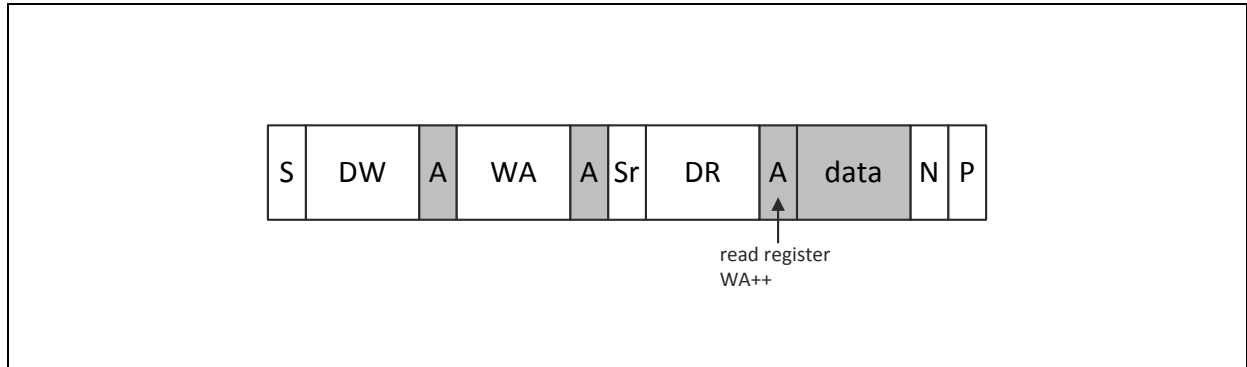

The transmission begins with the START condition, which is generated by the master when the bus is in IDLE state (the bus is free). The device-write address is followed by the word address. After the word address any number of data bytes can be sent to the slave. The word address is incremented internally, in order to write subsequent data bytes on subsequent address locations.

For reading data from the slave device, the master has to change the transfer direction. This can be done either with a repeated START condition followed by the device-read address, or simply with a new transmission START followed by the device-read address, when the bus is in IDLE state. The device-read address is always followed by the 1st register byte transmitted from the slave. In Read Mode any number of subsequent register bytes can be read from the slave. The word address is incremented internally.

I²C Read Access

Random, Sequential and Current Address Read are used to read data from the slave.

Figure 51:
I²C Random Read

Random Read and Sequential Read are combined formats. The repeated START condition is used to change the direction after the data transfer from the master.

The word address transfer is initiated with a START condition issued by the master while the bus is idle. The START condition is followed by the device-write address and the word address.

In order to change the data direction a repeated START condition is issued on the 1st SCL pulse after the acknowledge bit of the word address transfer. After the reception of the device-read address, the slave becomes the transmitter. In this state the slave transmits register data located by the previous received word address vector. The master responds to the data byte with a not-acknowledge, and issues a STOP condition on the bus.

Figure 52:
I²C Sequential Read

Sequential Read is the extended form of Random Read, as more than one register-data bytes are transferred subsequently. In difference to the Random Read, for a sequential read the transferred register-data bytes are responded by an acknowledge from the master.

The number of data bytes transferred in one sequence is unlimited (consider the behavior of the word-address counter). To terminate the transmission the master has to send a not-acknowledge following the last data byte and generate the STOP condition subsequently.

Figure 53:
I²C Current Address Read

To keep the access time as small as possible, this format allows a read access without the word address transfer in advance to the data transfer. The bus is idle and the master issues a START condition followed by the Device-Read address. Analogous to Random Read, a single byte transfer is terminated with a not-acknowledge after the 1st register byte. Analogous to Sequential Read an unlimited number of data bytes can be transferred, where the data bytes has to be responded with an acknowledge from the master. For termination of the transmission the master sends a not-acknowledge following the last data byte and a subsequent STOP condition.

I²C Parameter

Figure 54:
I²C SDA/SCL Characteristics

Symbol	Parameter	Min	Typ	Max	Unit
V _{IL}	SCL,SDA Low Level Input Voltage			0.4	V
V _{IH}	SCL,SDA High Level Input Voltage	1.4			V

The AS3709 is compatible to the NXP two wire specification www.nxp.com/documents/user_manual/UM10204.pdf Version 4.0 Feb 2012 for standard mode and fast mode (no fast mode plus or high speed mode support).

Figure 66:
GPIOsignal_out Register (Address 20h)

Addr: 20h		GPIOsignal_out		
Bit	Bit Name	Default	Access	Bit Description
7:2	-	'b0000	N/A	Do not use
1	gpio2_out	0	RW	This bit determines the output signal of the GPIO2 pin when selected as output source.
0	gpio1_out	0	RW	This bit determines the output signal of the GPIO1 pin when selected as output source.

Figure 67:
GPIOsignal_in Register (Address 21h)

Addr: 21h		GPIOsignal_in		
Bit	Bit Name	Default	Access	Bit Description
7:2	-	'b0000	N/A	Do not use
1	gpio2_in	0	RO	This bit reflects the logic level of the GPIO2 pin when configured as digital input pin.
0	gpio1_in	0	RO	This bit reflects the logic level of the GPIO1 pin when configured as digital input pin.

Figure 68:
Reg1_Voltage Register (Address 22h)

Addr: 22h		Reg1_Voltage		
Bit	Bit Name	Default	Access	Bit Description
7:0	reg1_voltage	'b0000 0000	RW	This register is mapped to the register address 0h+Reg1_select, if gioX_iosf = 5 or 6 (Vselect input), and input = 1. This feature allows voltage switching of a predefined regulator with just one GPIO input. 0..FFh : Selects voltage and frequency bits of DC/DC

Figure 69:
Reg2_Voltage Register (Address 23h)

Addr: 23h		Reg2_Voltage		
Bit	Bit Name	Default	Access	Bit Description
7:0	reg2_voltage	'b0000 0000	RW	This register is mapped to the register address 0h+Reg1_select, if gioX_iosf=5 or 6 (Vselect input), and input = 1, This feature allows voltage switching of a predefined regulator with just one GPIO input 0..FFh : Selects voltage and frequency bits of DC/DC

Figure 70:
Reg_control Register (Address 24h)

Addr: 24h		Reg_control		
Bit	Bit Name	Default	Access	Bit Description
7:4	reg2_select	'b1111	RW	Selects regulator for mapping feature; if reg_select2 ≥ 0Ch, then feature is disabled.
3:0	reg1_select	'b1111	RW	Selects regulator for mapping feature; if reg_select1 ≥ 0Ch, then feature is disabled.

Figure 71:
GPIOctrl_sd Register (Address 25h)

Addr: 25h		GPIOctrl_sd		
Bit	Bit Name	Default	Access	Bit Description
7:6	gpio_ctrl_sd4	'b00	RW	Enable GPIO control of DC/DC SD4. GPIO ctrl only enabled, if sd4_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA
5:4	gpio_ctrl_sd3	'b00	RW	Enable GPIO control of DC/DC SD3. GPIO ctrl only enabled, if sd3_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA
3:2	gpio_ctrl_sd2	'b00	RW	Enable GPIO control of DC/DC SD2. GPIO ctrl only enabled, if sd2_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA
1:0	gpio_ctrl_sd1	'b00	RW	Enable GPIO control of DC/DC SD1. GPIO ctrl only enabled, if sd1_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA

Figure 72:
GPIOctrl_Ido Register (Address 26h)

Addr: 26h		GPIOctrl_Ido		
Bit	Bit Name	Default	Access	Bit Description
7:6	-	'b00	N/A	-
5:4	gpio_ctrl_ldo2	'b00	RW	Enable GPIO control of LDO2. GPIO ctrl only enabled, if ldo2_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA
3:2	gpio_ctrl_ldo1	'b00	RW	Enable GPIO control of LDO1. GPIO ctrl only enabled, if ldo1_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA
1:0	gpio_ctrl_sd5	'b00	RW	Enable GPIO control of SD5. GPIO ctrl only enabled, if sd5_vsel > 0 0 : No GPIO control 1 : Controlled by GPIO1 2 : Controlled by GPIO2 3 : NA

Figure 73:
SD_control3 Register (Address 29h)

Addr: 29h		SD_control3		
Bit	Bit Name	Default	Access	Bit Description
7	sd5_slave	0	RW	Enables slave mode of SD5 0 : Normal mode of SD5 1 : SD5 is slave of SD3
7	sd4_slave	0	RW	Enables slave mode of SD4 0 : Normal mode of SD4 1 : SD4 is slave of SD3
5	sd2_slave	0	RW	Enables slave mode of SD2 0 : Normal mode of SD2 1 : SD2 is slave of SD1
4	sd5_fsel	0	RW	Selects between high and low frequency range 0 : 2 or 3MHz frequency (selectable by sd5_freque) 1 : 3 or 4MHz frequency (selectable by sd5_freque)
3	sd5_fast	0	RW	Selects a faster regulation mode for SD5 suitable for larger load changes. 0 : Normal mode, Cext=10μF 1 : Fast mode, Cext=22μF required
2	sd5_low_noise	0	RW	Enables low noise mode of SD5. If enabled smaller current pulses and output ripple is activated. 0 : Normal mode. Minimum current pulses of >100mA applied in skip mode. 1 : Low noise mode. Only minimum on time applied in skip mode.
1:0	-	'b00	N/A	-

Figure 74:
SD_control1 Register (Address 30h)

Addr: 30h		SD_control1		
Bit	Bit Name	Default	Access	Bit Description
7	sd4_low_noise	0	RW	Enables low noise mode of SD4. If enabled smaller current pulses and output ripple is activated. 0 : Normal mode. Minimum current pulses of >100mA applied in skip mode. 1 : Low noise mode. Only minimum on time applied in skip mode.
6	sd3_low_noise	0	RW	Enables low noise mode of SD3. If enabled smaller current pulses and output ripple is activated. 0 : Normal mode. Minimum current pulses of >100mA applied in skip mode. 1 : Low noise mode. Only minimum on time applied in skip mode.
5	sd2_low_noise	0	RW	Enables low noise mode of SD2. If enabled smaller current pulses and output ripple is activated. 0 : Normal mode. Minimum current pulses of >100mA applied in skip mode. 1 : Low noise mode. Only minimum on time applied in skip mode.
4	sd1_low_noise	0	RW	Enables low noise mode of SD1. If enabled smaller current pulses and output ripple is activated. 0 : Normal mode. Minimum current pulses of >100mA applied in skip mode. 1 : Low noise mode. Only minimum on time applied in skip mode.
3	sd4_fast	0	RW	Selects a faster regulation mode for SD4 suitable for larger load changes. 0 : Normal mode, Cext=10μF 1 : Fast mode, Cext=22μF required
2	sd3_fast	0	RW	Selects a faster regulation mode for SD3 suitable for larger load changes. 0 : Normal mode, Cext=10μF 1 : Fast mode, Cext=22μF required
1	sd2_fast	0	RW	Selects a faster regulation mode for SD2 suitable for larger load changes. 0 : Normal mode, Cext=10μF 1 : Fast mode, Cext=22μF required
0	sd1_fast	0	RW	Selects a faster regulation mode for SD1 suitable for larger load changes. 0 : Normal mode, Cext=10μF 1 : Fast mode, Cext=22μF required

Figure 75:
SD_control2 Register (Address 31h)

Addr: 31h		SD_control2		
Bit	Bit Name	Default	Access	Bit Description
7:6	sd_dvm_select	'b00	RW	Apply DVM counter to the following DC/DC converter 0 : Select SD1 for DVM 1 : Select SD2 for DVM 2 : Select SD3 for DVM 3 : Select SD5 for DVM
5:4	dvm_time	'b00	RW	Time steps of DVM voltage change of selected step down, if voltage of step Down is changed during operation (sd _x _vsel) voltage is decreased/increased by single steps 12.5mV 0 : 0 μ s, immediate change (no DVM) 1 : 4 μ s time delay between steps 2 : 8 μ s time delay between steps 3 : 16 μ s time delay between steps
3	sd4_fsel	0	RW	Selects between high and low frequency range 0 : 2 or 3MHz frequency (selectable by sd4_frequ) 1 : 3 or 4MHz frequency (selectable by sd4_frequ)
2	sd3_fsel	0	RW	Selects between high and low frequency range 0 : 2 or 3MHz frequency (selectable by sd3_frequ) 1 : 3 or 4MHz frequency (selectable by sd3_frequ)
1	sd2_fsel	0	RW	Selects between high and low frequency range 0 : 2 or 3MHz frequency (selectable by sd2_frequ) 1 : 3 or 4MHz frequency (selectable by sd2_frequ)
0	sd1_fsel	0	RW	Selects between high and low frequency range 0 : 2 or 3MHz frequency (selectable by sd1_frequ) 1 : 3 or 4MHz frequency (selectable by sd1_frequ)

Figure 76:
Supply_voltage_monitor Register (Address 32h)

Addr: 32h		Supply_voltage_monitor		
Bit	Bit Name	Default	Access	Bit Description
7	FastResEn	0	RW	0 : ResVoltFall debounce time = 3ms 1 : ResVoltFall debounce time = 4 μ s (tbd)
6	SupResEn	0	RW	0 : A reset is generated if V_{SUP} falls below 2.7V ⁽¹⁾ 1 : A reset is generated if V_{SUP} falls below ResVoltFall
5:3	ResVoltFall	'b000	RW	This value determines the reset level ResVoltFall for falling V_{SUP} . It is recommended to set this value at least 200mV lower than ResVoltRise (the levels differ between 3.3V and 5V supply) 0 : 2.7V / 3.6V 1 : 2.8V / 3.7V 2 : 2.9V / 3.8V 3 : 3.0V / 3.9V 4 : 3.1V / 4.0V 5 : 3.2V / 4.1V 6 : 3.3V / 4.2V 7 : 3.4V / 4.4V
2:0	ResVoltRise	'b000	RO (OTP)	This value determines the reset level ResVoltRise for rising V_{SUP} . It is recommended to set this value at least 200mV higher than ResVoltFall (the levels differ between 3.3V and 5V supply) 0 : 2.7V / 3.6V 1 : 2.8V / 3.7V 2 : 2.9V / 3.8V 3 : 3.0V / 3.9V 4 : 3.1V / 4.0V 5 : 3.2V / 4.1V 6 : 3.3V / 4.2V 7 : 3.4V / 4.4V

Note(s):

1. If V_{SUP} falls below ResVoltFall only an interrupt is generated (if enabled) and the μ Processor can shut down the system.

Figure 77:
Startup_Control Register (Address 33h)

Addr: 33h		Startup_Control		
Bit	Bit Name	Default	Access	Bit Description
7:2	-	'b000 0000	N/A	Do not use
1	reslevel_5v	0	RW	Selects the 5V supply reset level (see ResVoltRise and ResVoltFall) 0 : 3.3V level 1 : 5.0V level
0	power_off_at_vsuplow	0	RW	Switch on Power off mode if low V_{SUP} is detected during active or standby mode (Pin ON= low and bit auto_off=0) 0 : If low V_{SUP} is detected, V_{SUP} is continuously monitored and chip startup initiated if V_{SUP} is above ResVoltRise 1 : If low V_{SUP} is detected, enter power off mode

Figure 78:
ResetTimer Register (Address 34h)

Addr: 34h		ResetTimer		
Bit	Bit Name	Default	Access	Bit Description
7	-	'b0	N/A	Do not use
6	stby_reset_disable	0	RW	Disable Reset output signal (pin XRES) in standby mode. 0 : Normal mode, reset is active in standby mode 1 : No reset in standby mode and during exit of stand-by mode
5	auto_off	0	RO	Defines startup behavior at first V _{SUP} connection 0 : Startup of chip if V _{SUP} >ResVoltRise 1 : Enter power off mode (Startup with ON key)
4:3	off_delay	'b01	RW	Set delay between I ² C command, GPIO or Reset signal for power_off, standby mode or reset and execution of that command. 0 : No delay 1 : 8 ms 2 : 16 ms 3 : 32 ms
2:0	res_timer	'b000	RW	Set Reset Time, after the last regulator has started 0 : RESTIME = 2ms 1 : RESTIME = 4ms 2 : RESTIME = 8ms 3 : RESTIME = 16ms 4 : RESTIME = 32ms 5 : RESTIME = 64ms 6 : RESTIME = 128ms 7 : RESTIME = 160ms

Figure 79:
ReferenceControl Register (Address 35h)

Addr: 35h		ReferenceControl		
Bit	Bit Name	Default	Access	Bit Description
7	on_reset_delay	0	RW	Sets the on reset delay time 0 : 8 s (if onkey_reset=1) 1 : 4 s (if onkey_reset=1)
6	-	0	RW	-
5	clk_div2	0	RW	Divide internal clock oscillator by 2 to reduce quiescent current for low power operation 0 : Normal mode 1 : Internal clock frequency divided by two. All timings are increased by two. Switching frequency of all DC/DC converters are divided by two. Reduced transient performance of DC/DC converters.
4	standby_mode_on	0	RW	Setting to 1 sets the PMU into standby mode. All regulators are disabled except those regulators enabled by register Reg standby mode. XRES will be pulled to low. A normal startup of all regulators will be done with any interrupt (has to be enabled before entering standby mode). During this startup, regulators defined by Reg standby mode register are continuously on.
3:1	clk_int	'b000	RW	Sets the internal CLK frequency f_{CLK} used for fuel gauge, DC/DCs, PWM, ... 0 : 4 MHz (default) 1 : 3.8 MHz 2 : 3.6 MHz 3 : 3.4 MHz 4 : 3.2 MHz 5 : 3.0 MHz 6 : 2.8 MHz 7 : 2.6 MHz All frequencies, timings and delays in this datasheet are based on 4MHz clk_int
0	low_power_on	0	RW	Enable low power mode of internal reference. 0 : Standard mode 1 : Low power mode - all specification except noise parameters are still valid. Iq reduced by approx. 30 μ A

Figure 80:
ResetControl Register (Address 36h)

Addr: 36h		ResetControl			
Bit	Bit Name	Default	Access	Bit Description	
7	onkey_reset	0	RW	0 : Reset after 4/8 seconds ON pressed disabled 1 : Reset after 4/8 seconds ON pressed enabled	
6:3	reset_reason	'b0000	RW	Flags to indicate to the software the reason for the last reset 0 : V _{POR} has been reached (V _{SUP} connection from scratch) 1 : ResVoltFall was reached (V _{SUP} drop below 2.75V) 2 : Software forced by force_reset 3 : Software forced by power_off and ON was pulled high 4 : Software forced by power_off and charger was detected 5 : External triggered through the pin XRES 6 : Reset caused by overtemperature T140 7 : NA 8 : Reset caused by 4/8 seconds ON press 9 : NA 10 : NA 11 : Reset caused by interrupt in standby mode 12 : Reset caused by ON pulled high in standby mode	
2	on_input	0	R_PUSH	Read: This flag represents the state of the ON pad directly Write: Setting to 1 resets the 4/8 seconds. onkey_reset timer	
1	power_off	0	RW	Setting to 1 starts a reset cycle, but waits after the Reg_off state for a falling edge on the pin ON	
0	force_reset	0	RW	Setting to 1 starts a complete reset cycle	

Figure 81:
OvertemperatureControl Register (Address 37h)

Addr: 37h		OvertemperatureControl		
Bit	Bit Name	Default	Access	Bit Description
7	tco_140_a	b0	RO	Only used for production test
6	tco_110_a	b0	RO	Only used for production test
5:4	temp_test	b00	RW	
3	rst_ov_temp_140	0	RWP	If the overtemperature threshold 2 has been reached, the flag ov_temp_140 is set and a reset cycle is started. ov_temp_140 should be reset by writing 1 and afterward 0 to rst_ov_temp_140.
2	ov_temp_140	0	RO	Flag that the overtemperature threshold 2 (T140) has been reached - this flag is not reset by an overtemperature caused reset and has to be reset by rst_ov_temp_140.
1	ov_temp_110	0	RO	Flag that the overtemperature threshold 1 (T110) has been reached
0	temp_pmc_on	1	RO	Switch on / off the temperature supervision; default: on - all other bits are only valid if set to 1 leave at 1, do not disable

Figure 82:
Reg_standby_mod1 Register (Address 39h)

Addr: 39h		Reg_standby_mod1		
Bit	Bit Name	Default	Access	Bit Description
7	disable_regpd	0	RW	This bit disables the pulldown of all regulators 0 : Normal operation approx. 1kΩ pulldown of all regulators 1 : Pulldown disabled >100kΩ of all regulators
6	ldo2_stby_on	0	RW	Enable LDO2 in standby mode
5	ldo1_stby_on	0	RW	Enable LDO1 in standby mode
4	sd5_stby_on	0	RW	Enable Step down 4 in standby mode
3	sd4_stby_on	0	RW	Enable Step down 4 in standby mode
2	sd3_stby_on	0	RW	Enable Step down 3 in standby mode
1	sd2_stby_on	0	RW	Enable Step down 2 in standby mode
0	sd1_stby_on	0	RW	Enable Step down 1 in standby mode

Figure 83:
RegStatus Register (Address 73h)

Addr: 73h		RegStatus		
Bit	Bit Name	Default	Access	Bit Description
7:5	-	'b000	N/A	Do not use
4	sd5_lv	0	RO	Bit is set when voltage of SD5 drops below low voltage threshold (-5%) (1ms debounce time default)
3	sd4_lv	0	RO	Bit is set when voltage of SD4 drops below low voltage threshold (-5%) (1ms debounce time default)
2	sd3_lv	0	RO	Bit is set when voltage of SD3 drops below low voltage threshold (-5%) (1ms debounce time default)
1	sd2_lv	0	RO	Bit is set when voltage of SD2 drops below low voltage threshold (-5%) (1ms debounce time default)
0	sd1_lv	0	RO	Bit is set when voltage of SD1 drops below low voltage threshold (-5%) (1ms debounce time default)

Figure 84:
InterruptMask1 Register (Address 74h)

Addr: 74h		InterruptMask1		
Bit	Bit Name	Default	Access	Bit Description
7	LowVsup_int_m	1	RW	Set to 0 to enable the interrupt
6	ovtmp_int_m	1	RW	Set to 0 to enable the interrupt
5	onkey_int_m	1	RW	Set to 0 to enable the interrupt
4	sd5_lv_int_m	1	RW	Set to 0 to enable the interrupt
3	sd4_lv_int_m	1	RW	Set to 0 to enable the interrupt
2	sd3_lv_int_m	1	RW	Set to 0 to enable the interrupt
1	sd2_lv_int_m	1	RW	Set to 0 to enable the interrupt
0	sd1_lv_int_m	1	RW	Set to 0 to enable the interrupt

Fuse 5 Register (Address a5h)

Addr: a5h		Fuse5		
Bit	Bit Name	Default	Access	Bit Description
7	LDO1_gpio1_sel	b0	RW	Enable GPIO1 control of LDO1 0 : No GPIO control 1 : Controlled by GPIO1
6	SD5_gpio1_sel	b0	RW	Enable GPIO1 control of SD5 0 : No GPIO control 1 : Controlled by GPIO1
5	on_reset_delay	b0	RW	Sets the on reset delay time 0 : 8 s (if onkey_reset = 1) 1 : 4 s (if onkey_reset = 1)
4	onkey_reset	b0	RW	0 : Reset after 4/8 seconds ON pressed disabled 1 : Reset after 4/8 seconds ON pressed enabled
3	gpio12_in_en	b0	RW	Enables input_pulldown for gpio1,gpio2 if this bit is set 0 : gpio1_mode and gpio2_mode are default (b011) 1 : gpio1_mode and gpio2_mode set to (b101) input with pulldown
2	power_off_at_vsuplow	b0	RW	Switch on Power off mode if low VSUP is detected during active or stand-by mode (ON = low and auto_off = 0) 0 : If low VSUP is detected, VSUP is continuously monitored and chip startup initiated if VSUP is above ResVoltRise 1 : If low VSUP is detected, enter power off mode
1	sd1_5_fsel	b0	RW	Selects between high and low frequency range 0 : 2 or 3MHz frequency (selectable by sd1...sd5_frequ) 1 : 3 or 4MHz frequency (selectable by sd1...sd5_frequ)
0	sd1_5_fast	b0	RW	Selects a faster regulation mode for SD1...SD5 suitable for larger load changes 0 : Normal mode, Cout (according spec) 1 : Fast mode, 2 x Cout (according spec)

Application Information

Figure 103:
Application Schematic

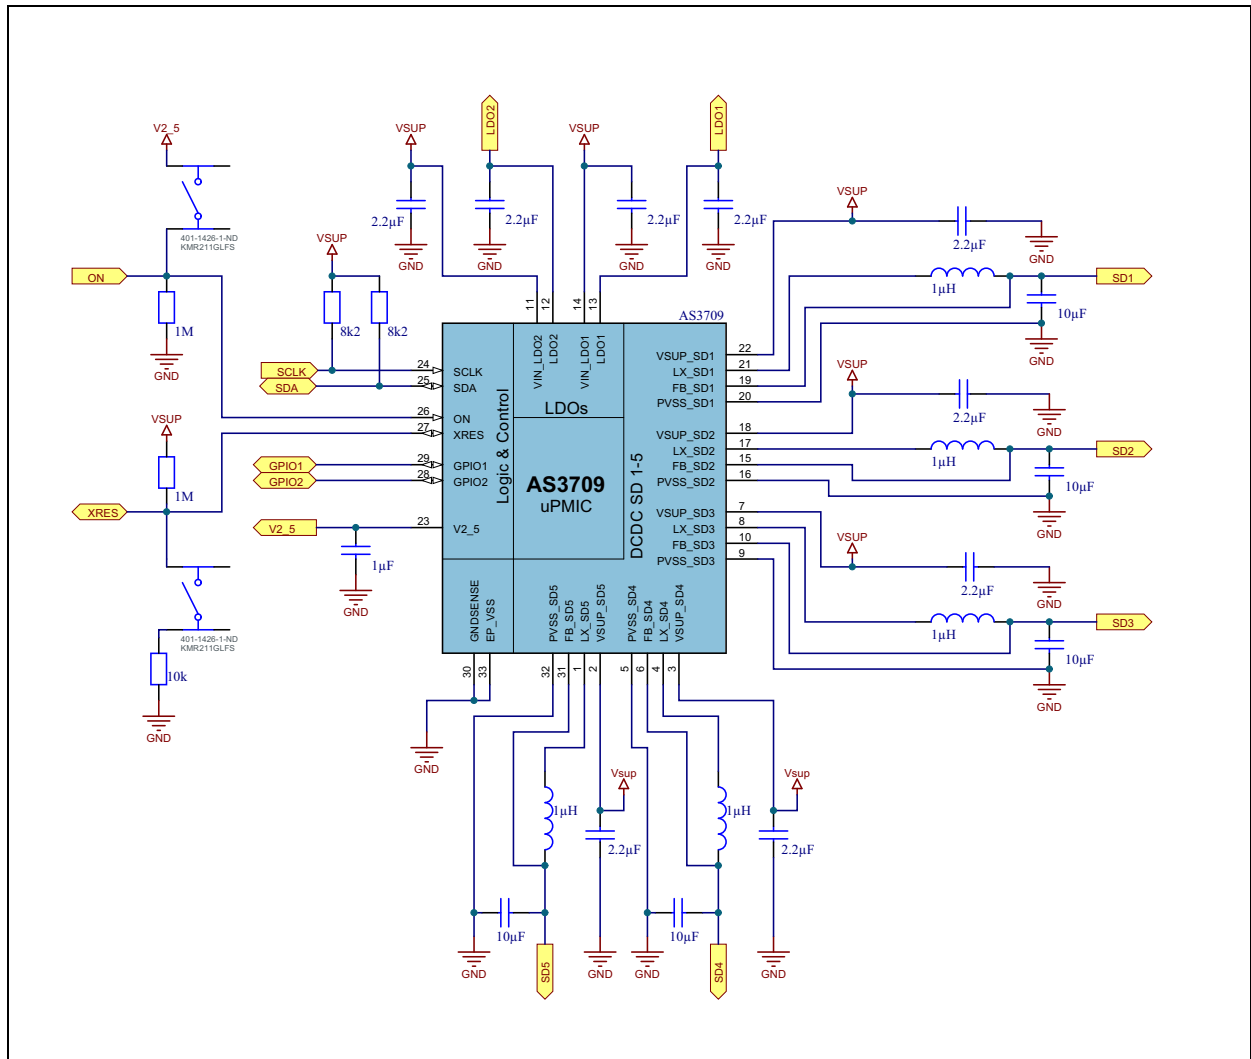

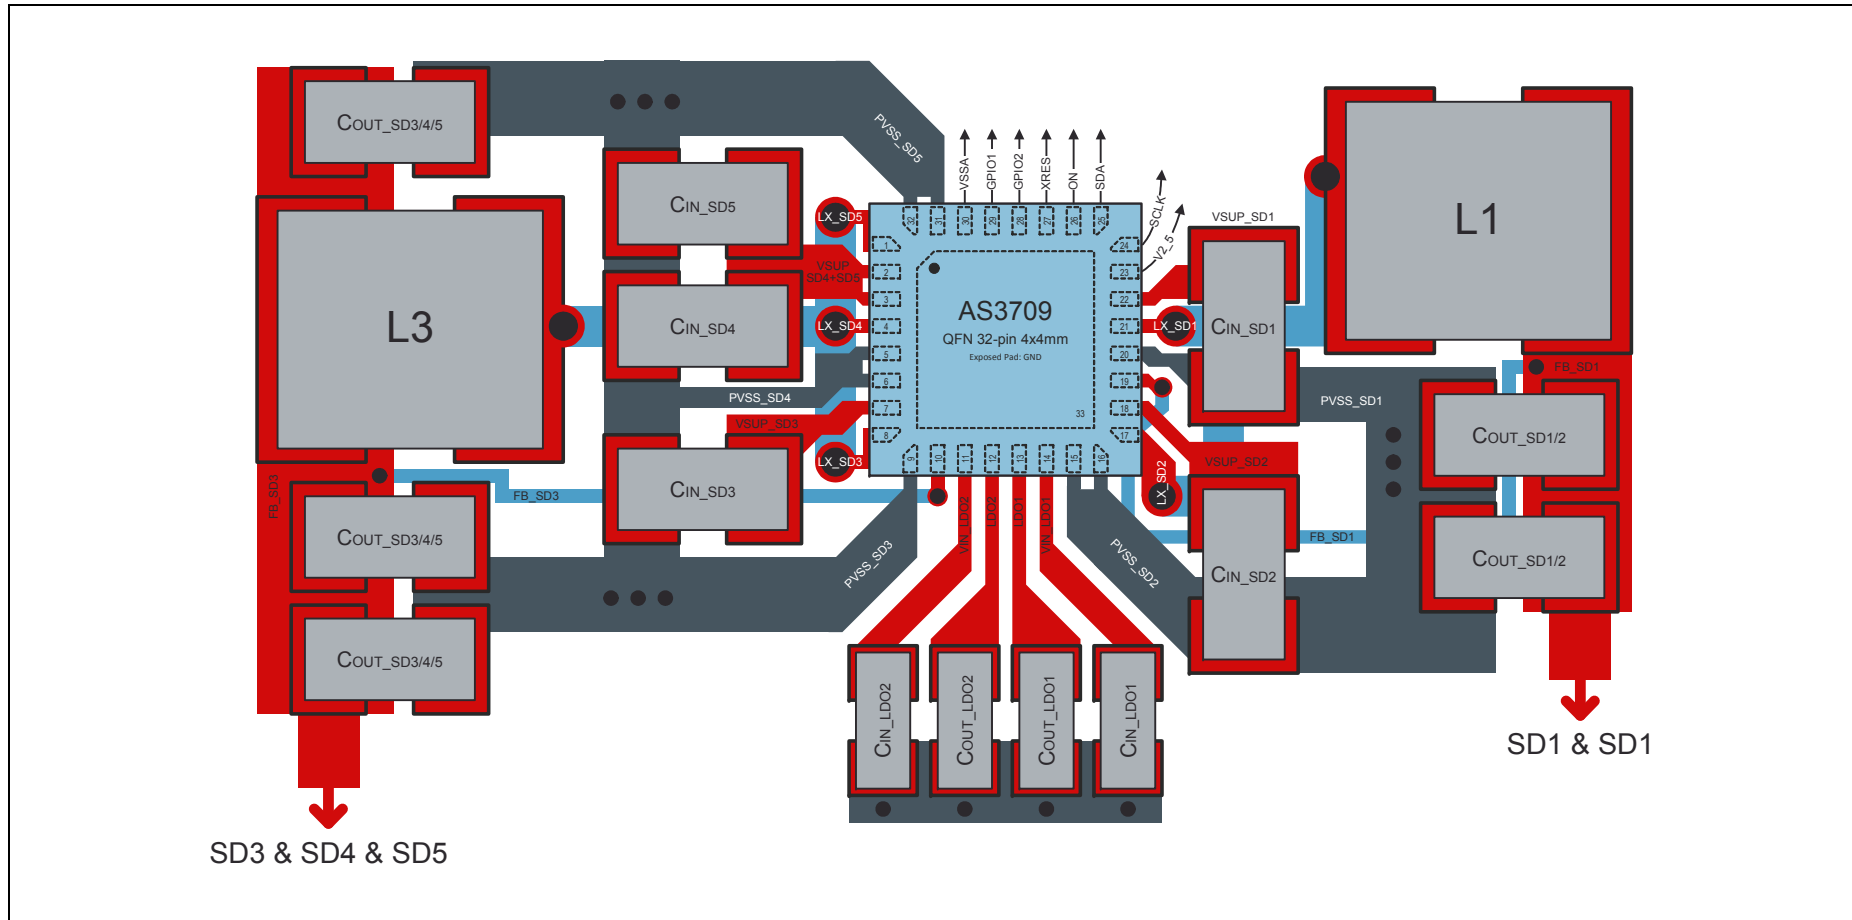

Figure 104:
Layout Guidelines 1/3

Layout Guidelines 1/3: This figure shows the recommended layout and placement of the external components for the 5 x 1A application circuit. Red lines and areas are connections on TOP layer. Grey lines and areas are GND and PVSS connections on TOP layer. Light blue lines and areas are connections on an inner layer or BOTTOM layer. Black round dots are vias. VSUP areas should be connected to an inner VSUP plane via vias. GND and PVSS areas should be connected to an inner GND plane via vias. A PCB with minimum 4 layers is recommended.

Figure 105:
Layout Guidelines 2/3

Layout Guidelines 2/3: This figure shows the recommended layout and placement of the external components for the 1 x 2A & 1 x 3A application circuit. Red lines and areas are connections on TOP layer. Grey lines and areas are GND and PVSS connections on TOP layer. Light blue lines and areas are connections on an inner layer or BOTTOM layer. Black round dots are vias. VSUP areas should be connected to an inner VSUP plane via vias. GND and PVSS areas should be connected to an inner GND plane via vias. A PCB with minimum 4 layers is recommended.

Figure 106:
WL-CSP Layout Guidelines 3/3

Layout Guidelines 3/3: This figure shows the recommended layout and placement of the external components for the 1 x 1A & 2 x 2A application circuit. Red lines and areas are connections on TOP layer. Dark red lines and areas are GND and PVSS lines on TOP layer. Orange lines and areas are VSUP lines on TOP layer. Light green lines and areas are connections on an inner layer and light blue lines and areas are connections on BOTTOM layer. Black round dots are vias. VSUP areas should be connected to an inner VSUP plane via vias. GND and PVSS areas should be connected to an inner GND plane via vias. A PCB with min 6 layers is recommended.

Package Drawings & Markings

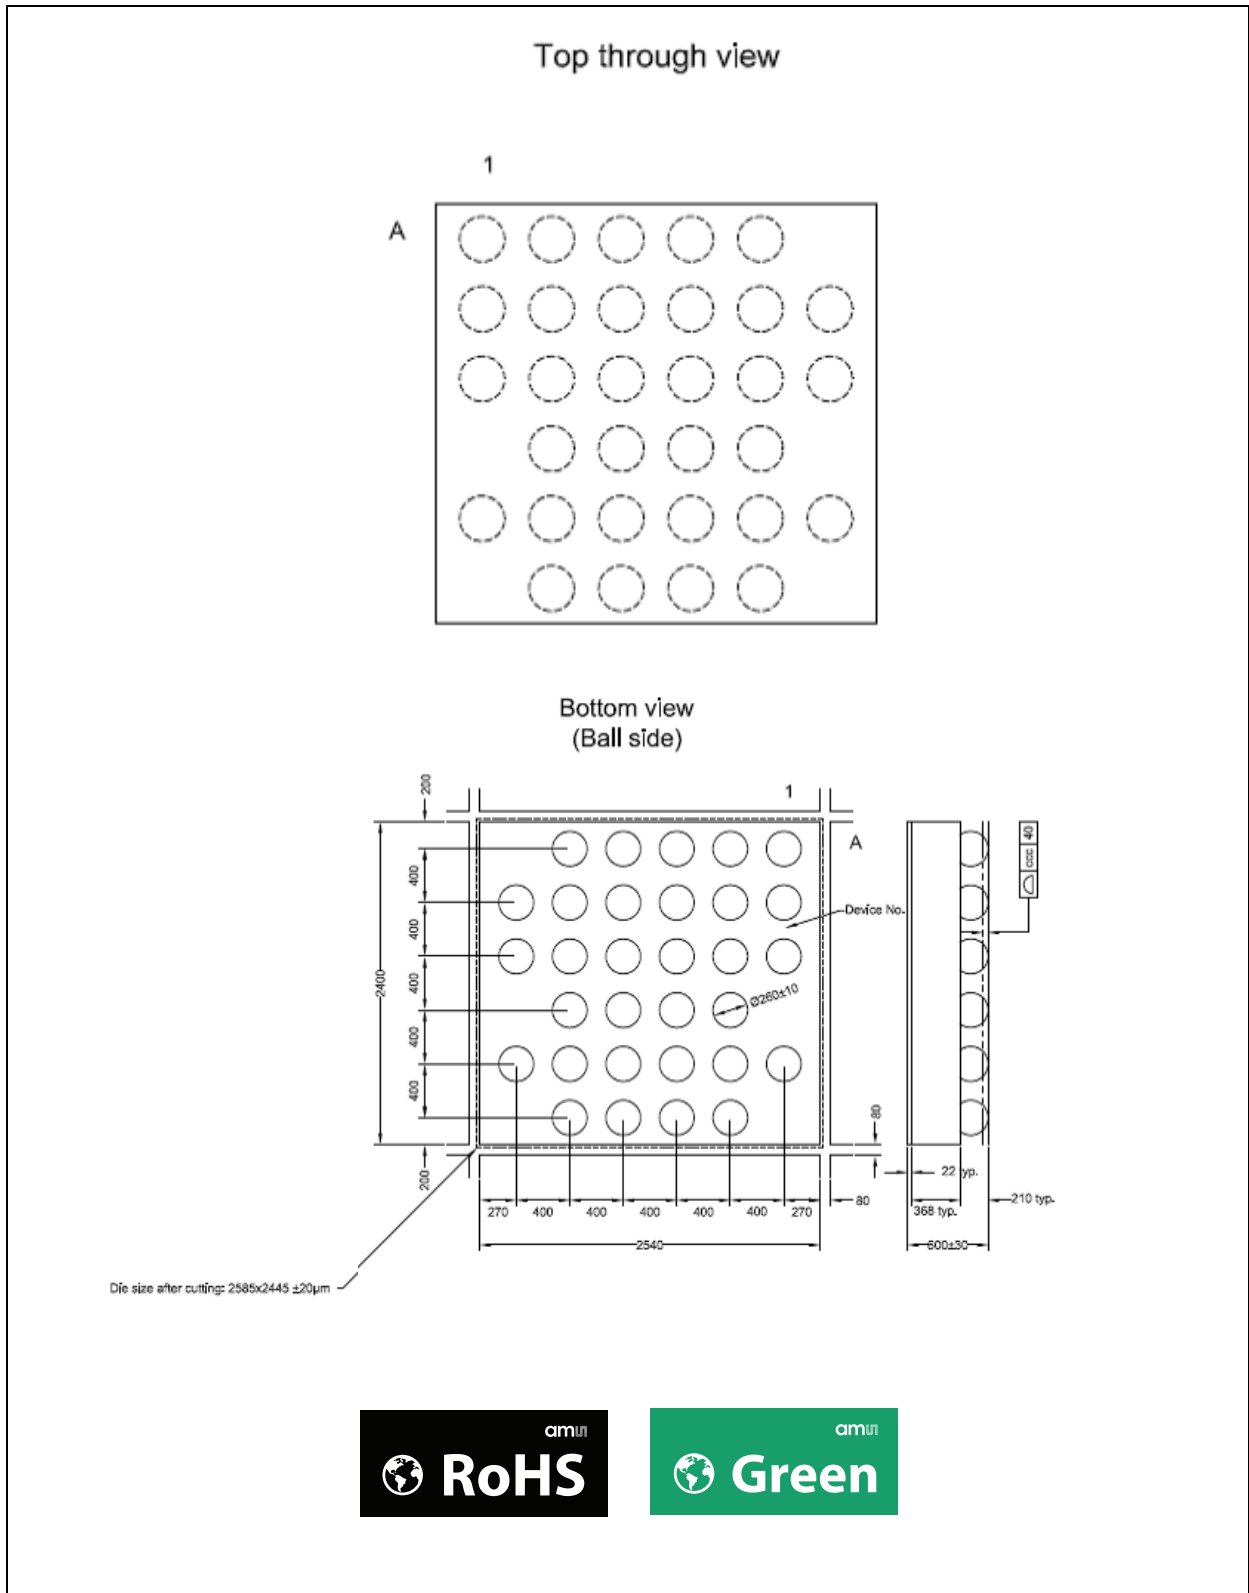

Figure 107:
QFN32 4x4 0.4mm Pitch Package Drawing

Note(s):

1. Dimensioning and tolerancing conform to ASME Y14.5M-1994.
2. All dimensions are in millimeters. Angles are in degrees.
3. Dimension b applies to metallized terminal and is measured between 0.25mm and 0.30mm from terminal tip. Dimension L1 represents terminal full back from package edge up to 0.15mm is acceptable.
4. Coplanarity applies to the exposed heat slug as well as the terminal.
5. Radius on terminal is optional.
6. N is the total number of terminals.

Figure 108:
WL-CSP36 0.4mm Pitch Package Drawing

Note(s):

1. Pin 1 = A1
2. ccc Coplanarity
3. All linear dimensions are in μm

RoHS Compliant & ams Green Statement

RoHS: The term RoHS compliant means that ams AG products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, RoHS compliant products are suitable for use in specified lead-free processes.

ams Green (RoHS compliant and no Sb/Br): ams Green defines that in addition to RoHS compliance, our products are free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

Important Information: The information provided in this statement represents ams AG knowledge and belief as of the date that it is provided. ams AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams AG and ams AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

Copyrights & Disclaimer

Copyright ams AG, Tobelbader Strasse 30, 8141 Premstaetten, Austria-Europe. Trademarks Registered. All rights reserved. The material herein may not be reproduced, adapted, merged, translated, stored, or used without the prior written consent of the copyright owner.

Devices sold by ams AG are covered by the warranty and patent indemnification provisions appearing in its General Terms of Trade. ams AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein. ams AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with ams AG for current information. This product is intended for use in commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by ams AG for each application. This product is provided by ams AG "AS IS" and any express or implied warranties, including, but not limited to the implied warranties of merchantability and fitness for a particular purpose are disclaimed.

ams AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of ams AG rendering of technical or other services.

Document Status

Document Status	Product Status	Definition
Product Preview	Pre-Development	Information in this datasheet is based on product ideas in the planning phase of development. All specifications are design goals without any warranty and are subject to change without notice
Preliminary Datasheet	Pre-Production	Information in this datasheet is based on products in the design, validation or qualification phase of development. The performance and parameters shown in this document are preliminary without any warranty and are subject to change without notice
Datasheet	Production	Information in this datasheet is based on products in ramp-up to full production or full production which conform to specifications in accordance with the terms of ams AG standard warranty as given in the General Terms of Trade
Datasheet (discontinued)	Discontinued	Information in this datasheet is based on products which conform to specifications in accordance with the terms of ams AG standard warranty as given in the General Terms of Trade, but these products have been superseded and should not be used for new designs
