

MAX17783CEVKITA# Evaluation Kit

Evaluates: MAX17783C in 3.3V Output-Voltage Application

General Description

The MAX17783CEVKITA# evaluation kit (EV kit) provides a proven design to evaluate the MAX17783C high-efficiency, high-voltage, Himalaya step-down DC-DC converter. The EV kit generates 3.3V output at load currents up to 2.5A from a 6V to 60V input supply. The switching frequency of the EV kit is preset to 500kHz for optimum efficiency and component size. The EV kit features adjustable input undervoltage lockout, adjustable soft-start, open-drain $\overline{\text{RESET}}$ signal, and external clock synchronization. The EV kit also provides a good layout example, which is optimized for thermal performance. For more details about the IC benefits and features, refer to the MAX17783C IC data sheet.

Features

- Operates from a 6V to 60V Input Supply
- 3.3V Output Voltage
- Delivers Up to 2.5A Output Current
- 500kHz Switching Frequency
- Enable/UVLO Input, Resistor-Programmable UVLO Threshold
- Adjustable Soft-Start Time
- External Clock Synchronization
- Open-Drain $\overline{\text{RESET}}$ Output
- Overcurrent and Overtemperature Protection
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

Quick Start

Recommended Equipment

- MAX17783CEVKITA#
- 6V to 60V, 3A DC input power supply
- Load capable of sinking 2.5A
- 2 digital voltmeters (DVM)

Equipment Setup and Test Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Set the power supply at a voltage between 6V and 60V. Disable the power supply.
- 2) Connect the positive terminal of the power supply to the VIN PCB pad and the negative terminal to the nearest PGND PCB pad. Connect the positive terminal of the 2.5A load to the VOUT PCB pad and the negative terminal to the nearest PGND PCB pad.
- 3) Connect one DVM across the VOUT PCB pad and the nearest PGND PCB pad.
- 4) Verify that shunts are not installed across the pins on jumper JU1 (see [Table 1](#) for details).
- 5) Turn on the DC power supply.
- 6) Enable the load.
- 7) Ensure that input voltage to be 6V or higher, with which EN/UVLO voltage is more than EN/UVLO rising threshold.
- 8) Verify that the DVM displays 3.3V.
- 9) Connect the other DVM across the $\overline{\text{RESET}}$ pad and GND. Verify that the DVM displays 5V.
- 10) The power supply voltage can be set at any voltage between 6V and 60V.
- 11) Reduce the input voltage to 4.7V which is below the EN/UVLO falling threshold.
- 12) Verify that the DVM across the VOUT PCB pad and the nearest PGND PCB pad displays 0V.
- 13) Verify that the DVM across the $\overline{\text{RESET}}$ pad and the nearest GND pad displays 0V.
- 14) Disable the input power supply.

MAX17783CEVKITA# Evaluation Kit

Evaluates: MAX17783C in 3.3V Output-Voltage Application

Detailed Description

The MAX17783CEVKITA# provides a proven design to evaluate the MAX17783C high-efficiency, high-voltage, Himalaya step-down DC-DC converter. The EV kit generates 3.3V output at load currents up to 2.5A from a 6V to 60V input supply. The EV kit features a 500kHz switching frequency for optimum efficiency and component size. The EV kit includes an EN/UVLO PCB pad and JU1 to enable the output at a desired input voltage or enable the converter through an external enable signal on the EN/UVLO PCB pad. The RT/SYNC PCB pad allows the application of an external clock to synchronize the device. An additional RESET PCB pad is available for monitoring whether the converter output is in regulation.

Soft-Start Input (SS)

The EV kit offers an adjustable soft-start function to limit inrush current during startup. The soft-start time is adjusted by the value of the external soft-start capacitor (C11) connected between SS and GND pins. The selected output capacitance (C_{SEL}) and the output voltage (V_{OUT}) determine the minimum required soft-start capacitor as follows:

$$C_{SS} \geq 28 \times 10^{-6} \times C_{SEL} \times V_{OUT}$$

The soft-start time (t_{SS}) is related to the capacitor connected at SS (C_{SS}) by the following equation:

$$t_{SS} = \frac{C_{SS}}{5.55 \times 10^{-6}}$$

For example, to program a 1ms soft-start time, a 5600pF capacitor should be connected from the SS pin to GND.

Enable/Undervoltage-Lockout (EN/UVLO) Programming

The MAX17783C offers an Enable and adjustable input undervoltage lockout feature. In this EV kit, for normal operation, leave the EN/UVLO jumper (JU1) open. When JU1 is left open, the MAX17783C is enabled when the input voltage rises above 5.6V. To disable the MAX17783C, install a jumper across pins 1–2 on JU1. See Table 1 for JU1 settings. The EN/UVLO PCB pad on the EV kit supports external Enable/Disable control of the device. Leave JU1 open when external Enable/Disable control is desired. A potential divider formed by R1 and R2 sets the input voltage (V_{INU}) above which the converter is enabled when JU1 is left open.

Choose R1 to be 3.32MΩ (max), and then calculate R2 as follows:

$$R2 = \frac{1.218 \times R1}{(V_{INU} - 1.218)}$$

where, V_{INU} is the voltage at which the device is required to turn on. For more details about setting the undervoltage lockout level, refer to the MAX17783C data sheet.

External Clock Synchronization (RT/SYNC)

The EV kit provides an RT/SYNC PCB pad to synchronize the MAX17783C to an optional external clock. For more details about external clock synchronization, refer to the MAX17783C data sheet.

Active-Low, Open-Drain Reset Output (RESET)

The EV kit provides a RESET PCB pad to monitor the status of the converter. RESET goes high 1024 switching cycles after V_{OUT} rises above 95% (typ) of its nominal regulated output voltage. RESET goes low when V_{OUT} falls below 92% (typ) of its nominal regulated voltage.

Hot Plug-In and Long Input Cables

The MAX17783CEVKITA# PCB layout provides an optional electrolytic capacitor (C6 = 33μF/100V). This capacitor limits the peak voltage at the input of the MAX17783C when the DC input source is “Hot-Plugged” to the EV kit input terminals with input cables. The equivalent series resistance (ESR) of the electrolytic capacitor dampens the oscillations caused by the interaction of the inductance of the long input cables, and the ceramic capacitors at the buck converter input.

Table 1. Converter EN/UVLO Jumper (JU1) Settings

SHUNT POSITION	EN/UVLO PIN	OUTPUT
Not installed*	Connected to the center node of resistor-divider R1 and R2	Enabled, UVLO level is set by the resistor-divider between IN and GND
1–2	Connected to GND	Disabled

*Default position.
