MAXIM

Low-Noise, Precision Op Amp

MXL1007

General Description

The Maxim MXL1007 operational amplifier features low-noise, ±15V performance: 2.5nV/√Hz wideband noise, 1/f corner frequency of 2Hz, and 60nVp-p 0.1Hz to 10Hz noise. Precision and speed performance includes 10µV typical offset voltage, 0.2µV/°C drift, 130dB CMRR and PSRR, and an 8MHz unity-gain stable bandwidth. In addition, the MXL1007's voltage gain is 20 million with a 2kΩ load and 12 million with a 600Ω load.

Maxim's MXL1007 is a pin-compatible alternative to other industry-standard low-noise op amps such as the OP27 and LT1007.

For applications requiring higher performance, see the MAX427/MAX437 and MAX410/MAX412/MAX414 data sheets.

Note 1: For supply voltages less than ±22V, the absolute maximum input voltage is equal to the supply voltage.
Note 2: MXL1007 inputs are protected by back-to-back diodes. Current-limiting resistors are not used in order to achieve low noise. If differential input voltage exceeds ±0.7V, the input current should be limited to 25mA.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 3: Input Offset Voltage measurements are performed by automatic test equipment approximately 0.5 sec after application of power.

Note 4: Long-Term Input Offset Voltage Stability refers to the average trend line of Offset Voltage vs. Time over extended periods after the first 30 days of operation. Excluding the initial hour of operation, changes in V_{OS} during the first 30 days are typically 2.5µV.

Note 5: This parameter is guaranteed by design and is not tested.

Note 6: See the test circuit for 0.1Hz to 10Hz tester in the *Typical Operating Characteristics* section.

Note 7: See the test circuit for current noise meaurement in the *Applications Information* section.

Note 8: The Average Input Offset Drift performance is within the specificaions unnulled or when nulled with a pot having a range of 8kΩ to 20kΩ. AM and AC grades are sample tested to 0.1% AQL. C grade is guaranteed by design.
