ACPL-K309T

Automotive Photovoltaic Driver with R^{2}Coupler™ Isolation

Overview

The Broadcom$^{®}$ ACPL-K309T is specifically designed to drive high voltage MOSFETs and/or IGBTs. It consists of an AlGaAs infrared light emitting diode (LED) input stage optically coupled to an output detector circuit. The detector consists of a photovoltaic diode array and a turn-off circuit. The photovoltaic driver is turned on with a minimum input current of 3 mA through the input LED. The MOSFET driver is turned off with an input voltage of 0.6V or less. This becomes a voltage source with galvanic isolation. The advantage of a photovoltaic driver is its simple design which does not require a secondary side bias supply.

The ACPL-K309T is available in the stretched SO-8 package outline, designed to be compatible with standard surface-mount processes.

Broadcom R^{2}Coupler isolation products provide reinforced insulation and reliability that delivers safe signal isolation critical in automotive and high temperature industrial applications.

Features

- Qualified to AEC-Q100 Test Guidelines
- Automotive temperature range: –40°C to +125°C
- Drive external power MOSFET/IGBT without isolated secondary supply
- Low I_F drive of 3 mA
- Open-Circuit Voltage: 14.3V typical at I_F = 10 mA
- Short-Circuit Current: 34 μA typical at I_F = 10 mA
- Fast switching speed for I_F = 10 mA, C_L = 1 nF:
  - Turn-on time: 0.26 ms typical
  - Turn-off time: 0.013 ms typical
- Regulatory approvals:
  - UL/cUL 1577 5kV$_{RMS}$ for 1 minute
 - IEC/EN 60747-5-5 V_{IORM} = 1260 V_{PEAK}

Applications

- Solid State Relay
- High-side Power Switch Control
- Battery Management System
- Pre-charge/Active Discharge Circuit in High Voltage System

Recommended Pb-Free IR Profile

Recommended reflow condition as per JEDEC Standard J-STD-020 (latest revision).

NOTE: Non-halide flux should be used.

Regulatory Information

The ACPL-K309T is approved by the following organizations.

UL/cUL	IEC/EN 60747-5-5
UL 1577, component recognition program up to V_{ISO} = 5000 V_{RMS}	V_{IORM} = 1260V_{PEAK} V_{IOTM} = 8000V_{PEAK}

IEC/EN 60747-5-5 Insulation Characteristics

Description	Symbol	Characteristic	Units
Installation classification per DIN VDE 0110/1.89, Table 1 for rated mains voltage ≤ 600 V$_{rms}$		I – IV	
Climatic Classification		40/125/21	
Pollution Degree (DIN VDE 0110/1.89)		2	
Maximum Working Insulation Voltage	V$_{IORM}$	1260	V$_{PEAK}$
Input to Output Test Voltage, Method b V$_{IORM}$ x 1.875 = V$_{PR}$, 100% Production Test with t$_m$ = 1s, Partial discharge < 5 pC	V$_{PR}$	2362	V$_{PEAK}$
Input to Output Test Voltage, Method a V$_{IORM}$ x 1.6 = V$_{PR}$, Type and Sample Test, t$_m$ = 10s, Partial discharge < 5 pC	V$_{PR}$	2016	V$_{PEAK}$
Highest Allowable Overvoltage (Transient Overvoltage t$_{ini}$ = 60s)	V$_{IOTM}$	8000	V$_{PEAK}$
Safety-limiting values – maximum values allowed in the event of a failure			
Case Temperature	T$_S$	175	°C
Input Current	I$_{S,INPUT}$	230	mA
Output Power	P$_{S,OUTPUT}$	600	mW
Insulation Resistance at T$_S$, V$_{IO}$ = 500V	R$_S$	> 10^9	Ω

Insulation and Safety Related Specifications

Parameter	Symbol		Units	Conditions
Minimum External Air Gap (Clearance)	L(101)	8	mm	Measured from the input terminals to the output terminals, shortest distance through the air.
Minimum External Tracking (Creepage)	L(102)	8	mm	Measured from the input terminals to the output terminals, shortest distance path along the body.
Minimum Internal Plastic Gap (Internal Clearance)		0.08	mm	Through insulation distance conductor to conductor, usually the straight line distance thickness between the emitter and the detector.
Tracking Resistance (Comparative Tracking Index)	CTI	>600	V	DIN IEC 112/VDE 0303 Part 1.
Isolation Group		I		Material Group (DIN VDE 0110).

ESD Ratings

Parameter	Classification	Note
Human Body Model	2	Per AEC Q100-002
Charge Device Model	C2a	Per AEC Q100-011

Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Units	Note

- T_A = 125°C, V_{TLH} = 8V, V_{THL} = 1V

Application Information

The ACPL-K309T automotive photovoltaic (PV) driver is a device that is paired with MOSFETs to form a basic building block for several types of application. A solid state relay is formed using a photovoltaic driver combined with one or two MOSFETs. When combined with two back to back MOSFETs, the combination forms a bidirectional switch. It consists of an AlGaAs LED input that is optically coupled to a photovoltaic diode array. This becomes a voltage source with galvanic isolation. The advantage of a photovoltaic driver is its simple design which does not require a secondary side bias supply.

Basic Construction

As shown in Figure 15, the input side of the PV Driver is LED driven. A current limiting resistor is required to limit the current through the LED. Recommended input forward current is 3 mA to 20 mA. The LED is optically coupled through a photodiode stack consisting photodiodes connected in series. When current is driven into the Light-Emitting Diode (LED) on the input side, the light from the LED generates photo current on the string of photodiodes to charge the gate of the MOSFETs, generating a photo-voltage proportional to the number of photodiodes, to switch and keep the power device on.

**Figure 15: Basic Construction of Photovoltaic Driver**
Input Drive Circuit

As shown in Figure 16, the current limiting resistor R_{LED} sets the input driving current (I_F) and it can be calculated by:

$$R_{LED} = \frac{V_{IN} - V_F}{I_F}$$

Where V_{IN} is the input voltage, V_F is the forward voltage of the LED, and the desired input current is I_F.

In order to prevent accidental turning-on of LED due to leakage current in the input, it is recommended to have a definite threshold input current for the LED. This threshold adjustment can be obtained by shunting the LED by a resistor (R_{SHUNT}), the value of which is determined by a ratio between the Input Threshold Current (I_{FT}) and Maximum Input LED Turn-Off Voltage ($V_{F(OFF)MAX}$). The circuit shown in Figure 16 shows the relationship between these values. The calculations will determine the shunt resistor value required for a given I_{FT} and $V_{F(OFF)MAX}$. In the following example, the maximum LED turn-off voltage is 0.6V (specified in Recommended Operating Conditions) and the input threshold current is set to 100 µA. The required shunt resistor value is approximately 6 kΩ. In this example, when LED is ON, a current value greater than 250 µA will flow through the shunt resistor.

Figure 16: Input Circuit
$$R_{SHUNT} = \frac{V_{F(OFF)MAX}}{I_{FT}}$$

$$R_{SHUNT} = \frac{0.6V}{100\mu A}$$

$$R_{SHUNT} = 6k\Omega$$

The recommended R_{SHUNT} value is approximately 6 kΩ.

Turn-Off Circuit

The photovoltaic driver has a built-in turn-off circuit, which decreases the turn-off time. This circuit instantaneously discharges the gate capacitance of MOSFETs once the photovoltaic driver is turned off. The turn-off circuit is activated when the photovoltaic voltage is collapsing. Referring to Figure 15, the operation sequence for the turn-off circuit is as follows:

When LED is ON:

1. Q1 and Q2 are saturated.

2. SCR (Q3 and Q4) is disabled.

3. Photodiode array is connected to Gate and Source.

When LED is OFF:

1. Q1 and Q2 cease to conduct.

2. Photodiode array is disconnected from Gate and Source.

3. SCR (Q3 and Q4) is triggered and gate capacitance (C_{GS}) is discharged rapidly.

PV Driver and MOSFET Configurations

The photovoltaic driver is a device that is combined with high voltage MOSFETs to form a solid-state relay. The photovoltaic driver can be configured with a single MOSFET or two MOSFETS (back-to-back) for bidirectional application. Pin 5 is connected to the Gate and Pin 7 is connected to the Source. Figure 17, 18, and 19 are sample application circuits for different combinations.

Thermal Resistance Model for ACPL-K309T

The diagram of ACPL-K309T for measurement is shown in Figure 20. Here, one die is heated first and the temperatures of all the dice are recorded after thermal equilibrium is reached. Then, the second die is heated and all the dice temperatures are recorded. With the known ambient temperature, the die junction temperature and power dissipation, the thermal resistance can be calculated. The thermal resistance calculation can be cast in matrix form. This yields a 2-by-2 matrix for our case of two heat sources.

Figure 20: Diagram of ACPL-K309T for Measurement

$$\begin{vmatrix} R_{11} & R_{12} \\ R_{21} & R_{22} \end{vmatrix} \times \begin{vmatrix} P_1 \\ P_2 \end{vmatrix} = \begin{vmatrix} \Delta T_1 \\ \Delta T_2 \end{vmatrix}$$

R_{11}: Thermal Resistance of Die1 due to heating of Die1.

R_{12}: Thermal Resistance of Die1 due to heating of Die2.

R_{21}: Thermal Resistance of Die2 due to heating of Die1.

R_{22}: Thermal Resistance of Die2 due to heating of Die2.

P_1: Power dissipation of Die1 (W).

P_2: Power dissipation of Die2 (W).

T_1: Junction temperature of Die1 due to heat from all dice (°C).

T_2: Junction temperature of Die2 due to heat from all dice (°C).

T_a: Ambient temperature.

ΔT_1: Temperature difference between Die1 junction and ambient (°C).

ΔT_2: Temperature difference between Die2 junction and ambient (°C).

$T_1 = R_{11} \times P_1 + R_{12} \times P_2 + T_a$

$T_2 = R_{21} \times P_1 + R_{22} \times P_2 + T_a$

Measurement data on a low K (conductivity) board:

R_{11}: 290°C/W

R_{12}: 89°C/W

R_{21}: 80°C/W

R_{22}: 136°C/W

Measurement data on a high K (conductivity) board:

R_{11}: 242°C/W

R_{12}: 42°C/W

R_{21}: 35°C/W

R_{22}: 86°C/W
