

### Features

- Logic & Mixed Signal Circuits
- Highly Versatile Macrocells
- 1.8V ( $\pm 5\%$ ) to 5V ( $\pm 10\%$ ) Supply
- Operating Temperature Range:  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- RoHS Compliant / Halogen-Free
- Pb-Free 12-pin STQFN: 1.6 x 1.6 x 0.55 mm, 0.4 mm pitch

### Applications

- Personal Computers and Servers
- PC Peripherals
- Consumer Electronics
- Data Communications Equipment
- Handheld and Portable Electronics

## 1.0 Overview

The SLG46120 provides a small, low power component for commonly used mixed-signal functions. The user creates their circuit design by programming the one time Non-Volatile Memory (NVM) to configure the interconnect logic, the I/O Pins and the macrocells of the SLG46120. This highly versatile device allows a wide variety of mixed-signal functions to be designed within a very small, low power single integrated circuit. The macrocells in the device include the following:

- Two Analog Comparators (ACMP)
- Voltage References (Vref)
- Five Combinatorial Look Up Tables (LUTs)
  - One 2-bit LUTs
  - Four 3-bit LUTs
- Twelve Combination Function Macrocell
  - Four Selectable DFF/Latch or 2-bit LUTs
  - Four Selectable DFF/Latch or 3-bit LUTs
  - One Selectable Pipe Delay or 3-bit LUT
    - Pipe Delay – 8 stage / 2 output, one 1 stage fixed output
  - Two Selectable Counter/Delay or 4-bit LUT
  - One Programmable Delay / Deglitch Filter
- Two Counter / Delay Generators (CNT/DLY)
  - One 8-bit counter/delay
  - One 14-bit counter/delay with external clock/reset
- Eight D Flip-Flop / Latches (DFF) (Part of Combination Function Macrocell)
- Pipe Delay – 8 stage/2 output (Part of Combination Function Macrocell)
- One Bandgap
- RC Oscillator (RC OSC)
- Power On Reset (POR)

### 2.1 Functional and Programming Pin Description

Pin #	Pin Name	Function	Programming Function
1	VDD	Power Supply	Power Supply
2	GPI	General Purpose Input	V <sub>PP</sub> (Programming Voltage)
3	GPIO	General Purpose I/O or Analog Comparator 0 (+)	Programming ID Pin
4	GPIO	General Purpose I/O or Analog Comparator 0 (-)	N/A
5	GPIO	General Purpose I/O	N/A
6	GPIO	General Purpose I/O or Analog Comparator 1 (+) with OE	N/A
7	GND	Ground	N/A
8	GPIO	General Purpose I/O	Programming Mode Control
9	GPIO	General Purpose I/O	Programming SDIO Pin
10	GPIO	General Purpose I/O with OE and Vref output	Programming SRDWB Pin
11	GPIO	General Purpose I/O	N/A
12	GPIO	General Purpose I/O or External Clock Input	Programming SCL Pin

### 3.0 User Programmability

Non-volatile memory (NVM) is used to configure the SLG46120's connection matrix routing and macrocells. The NVM is One-Time-Programmable (OTP). However, Silego's GreenPAK development tools can be used to configure the connection matrix and macrocells, without programming the NVM, to allow on-chip emulation. This configuration will remain active on the device as long as it remains powered and can be re-written as needed to facilitate rapid design changes.

When a design is ready for in-circuit testing, the same GreenPAK development tools can be used to program the NVM and create samples for small quantity builds. Once the NVM is programmed, the device will retain this configuration for the duration of its lifetime.

Once the design is finalized, the design file can be forwarded to Silego to integrate into the production process.

## 6.0 Summary of Macrocell Function

### 6.1 I/O Pins

- Digital Input (low voltage or normal voltage, with or without Schmitt Trigger)
- Open Drain NMOS and Open Drain PMOS Outputs
- Push Pull Outputs
- Analog I/O
- 10 k $\Omega$ /100 k $\Omega$ /1 M $\Omega$  pull-up/pull-down resistors

### 6.2 Connection Matrix

- Digital matrix for circuit connections based on user design

### 6.3 Analog Comparators (2 total)

- Selectable hysteresis 0 mV/25 mV/50 mV/200 mV and selectable gain 1x/0.5x/0.33x/0.25x

### 6.4 Voltage Reference

- Used for references on Analog Comparators
- Can also be driven to external pins

### 6.5 Combinational Logic Look Up Tables (LUTs – 5 total)

- One 2-bit Lookup Tables
- Four 3-bit Lookup Tables

### 6.6 Combination Function Macrocells (12 total)

- Four Selectable DFF/Latches or 2-bit LUTs
- Four Selectable DFF/Latches or 3-bit LUTs
- One Selectable Pipe Delay or 3-bit LUT
- Two Selectable CNT/DLYs or 4-bit LUTs
- One Programmable Delay or Deglitch Filter

### 6.7 Delays/Counters (2 total)

- One 8-bit delay/counter with external clock/reset: Range 1-255 clock cycles
- One 14-bit delay/counter with external clock/reset: Range 1-16383 clock cycles

### 6.8 Pipe Delay (Part of Combination Function Macrocell)

- 8 stage / 2 output
- Two 1-8 stage selectable outputs
- One 1 stage fixed output

### 6.9 Additional Logic Functions (Part of Combination Function Macrocell)

- One Deglitch filter macrocell
- One Programmable Delay
  - 163 ns / 305 ns / 446 ns / 588 ns @ 3.3 V
  - Includes Edge Detection function

## 6.10 RC Oscillator

- 25 kHz and 2 MHz selectable frequency
- First Stage Clock pre=divider (4): OSC/1, OSC/2, OSC/4, and OSC/8
- Second stage divider control with two outputs, OUT0 and OUT1 (8): selectable (OSC/1, OSC/2, OSC/3, OSC/4, OSC/8, OSC/12, OSC/24, or OSC/64)

## 6.11 Power On Reset (POR)

## 7.0 I/O Pins

The SLG46120 has a total of 10 multi-function I/O pins which can function as either a user defined Input or Output, as well as serving as a special function (such as outputting the voltage reference), or serving as a signal for programming of the on-chip Non Volatile Memory (NVM).

Normal Mode pin definitions are as follows:

- Pin 1:  $V_{DD}$  Power Supply
- Pin 2: General Purpose Input
- Pin 3: General Purpose I/O or Analog Comparator 0 (+)
- Pin 4: General Purpose I/O or Analog Comparator 0 (-)
- Pin 5: General Purpose I/O
- Pin 6: General Purpose I/O or Analog Comparator 1 (+) with OE
- Pin 7: Ground
- Pin 8: General Purpose I/O
- Pin 9: General Purpose I/O
- Pin 10: General Purpose I/O with OE and Vref Output
- Pin 11: General Purpose I/O
- Pin 12: General Purpose I/O or External Clock Input

Programming Mode pin definitions are as follows:

- Pin 1:  $V_{DD}$  Power Supply
- Pin 2:  $V_{PP}$  Programming Voltage
- Pin 3: Programming ID Pin
- Pin 7: Ground
- Pin 8: Programming Mode Control
- Pin 9: Programming SDIO Pin
- Pin 10: Programming SRDWB Pin
- Pin 12: Programming SCL Pin

Of the 10 user defined I/O pins on the SLG46120, all but one of the pins (Pin 2) can serve as both digital input and digital output. Pin 2 can only serve as a digital input pin.

### 7.1 Input Modes

Each I/O pin can be configured as a digital input pin with/without buffered Schmitt Trigger, or can also be configured as a low voltage digital input. Pins 3, 4, and 6 can also be configured to serve as analog inputs to the on-chip comparators.

### 7.2 Output Modes

Pins 3, 4, 5, 6, 8, 9, 10, 11, and 12 can all be configured as digital output pins.

### 7.3 Pull Up/Down Resistors

All I/O pins have the option for user selectable resistors connected to the input structure. The selectable values on these resistors are 10 k $\Omega$ , 100 k $\Omega$  and 1 M $\Omega$ . In the case of Pin 2, the resistors are fixed to a pull-down configuration. In the case of all other I/O pins, the internal resistors can be configured as either pull-up or pull-downs.

**8.0 Connection Matrix**

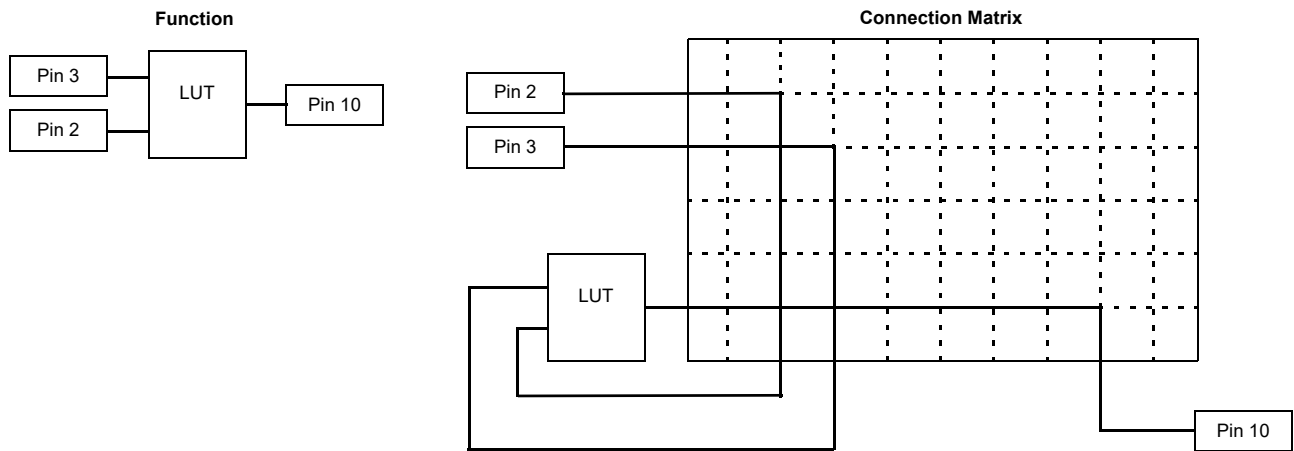

The Connection Matrix in the SLG46120 is used to create the internal routing for internal functions of the device once it is programmed. The registers are programmed from the one-time NVM cell during Test Mode Operation. All of the connection points for each logic cell within the SLG46120 have a specific digital bit code assigned to it that is either set to active “High” or inactive “Low” based on the design that is created. Once the 768 register bits within the SLG46120 are programmed a fully custom circuit will be created.

The Connection Matrix has 40 inputs and 64 outputs. Each of the 40 inputs to the Connection Matrix is hard-wired to a particular source macrocell, including I/O pins, LUTs, analog comparators, other digital resources and V<sub>DD</sub> and V<sub>SS</sub>. The input to a digital macrocell uses a 6-bit register to select one of these 40 input lines.

For a complete list of the SLG46120’s register table, see Section 16.0 Appendix A - SLG46120 Register Definition.

## 9.0 Combinatorial Logic

Combinatorial logic is supported via five Lookup Tables (LUTs) within the SLG46120. There is one 2-bit LUT and four 3-bit LUTs. The device also includes 11 Combination Function Macrocells that can be used as LUTs. For more details, please see Section 10.0 Combination Function Macrocells.

Inputs/Outputs for the four LUTs are configured from the connection matrix with specific logic functions being defined by the state of NVM bits. The outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

### 9.1 2-Bit LUT

The one 2-bit LUT takes in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix.

Figure 7. 2-bit LUT4

Table 18. 2-bit LUT4 Truth Table.

IN1	IN0	OUT
0	0	reg <412>reg
0	1	reg <413>reg
1	0	reg <414>reg
1	1	reg <415>reg

Each 2-bit LUT uses a 4-bit register signal to define their output functions;

*2-Bit LUT4 is defined by reg <415:412>*

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the two 2-bit LUT logic cells.

Table 19. 2-bit LUT Standard Digital Functions.

Function	MSB			LSB
AND-2	1	0	0	0
NAND-2	0	1	1	1
OR-2	1	1	1	0
NOR-2	0	0	0	1
XOR-2	0	1	1	0
XNOR-2	1	0	0	1

9.2 3-Bit LUT

The four 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix.

## 10.0 Combination Function Macrocells

The SLG46120 has twelve combination function macrocells that can serve more than one logic or timing function. In eleven of these cases, they can serve as a Look Up Table (LUT), or as another logic or timing function. In the last case, it can serve as either a programmable delay or deglitch filter. See the list below for the functions that can be implemented in these macrocells.

- Four macrocells that can serve as either 2-bit LUTs or as D Flip Flops
- Four macrocells that can serve as either 3-bit LUTs or as D Flip Flops
- One macrocell that can serve as either 3-bit LUT or as Pipe Delay
- Two macrocells that can serve as either 4-bit LUTs or as 8-Bit Counter / Delays
- One macrocell that can serve as either a Programmable Delay or as a Deglitch Filter

Inputs/Outputs for the eleven combination function macrocells are configured from the connection matrix with specific logic functions being defined by the state of NVM bits.

When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

When used as a D Flip Flop / Latch, the source and destination of the inputs and outputs for the DFF/Latches are configured from the connection matrix. All DFF/Latch macrocells have user selection for initial state, and all have the option to connect both the Q and Q Bar outputs to the connection matrix. The macrocells DFF2, DFF3 have an additional input from the matrix that can serve as a nSet or nReset function to the macrocell.

The operation of the D Flip-Flop and Latch will follow the functional descriptions below:

DFF: CLK is rising edge triggered, then  $Q = D$ ; otherwise Q will not change

Latch: if  $CLK = 0$ , then  $Q = D$

### 10.1 2-Bit LUT or D Flip Flop Macrocells

There are four macrocells that can serve as either 2-bit LUTs or as D Flip Flops. When used to implement LUT functions, the 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the two input signals from the connection matrix go to the data (d) and clock (clk) inputs for the Flip Flop, with the output going back to the connection matrix.

### 10.3 3-Bit LUT or Pipe Delay Macrocell

There is one macrocell that can serve as either a 3-bit LUT or as a Pipe Delay.

When used to implement LUT functions, the 3-bit LUT take in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix.

When used as an 8-stage pipe delay, there are three inputs signals from the matrix, Input (IN), Clock (CLK) and Reset (nRESET). The pipe delay macrocell is built from 8 D Flip-Flop logic cells that provide three register shifted options, two of which are user selectable. The DFF cells are tied in series where the output (Q) of each delay cell goes to the next DFF cell. The first delay option (1 PIPE OUT) is fixed at the output of the first flip-flop stage. The other two outputs (OUT0 and OUT1) provide user selectable options for 1 to 8 stages of delay.

The overall time of the delay is based on the clock used in the SLG46120 design. Each DFF cell has a time delay of the inverse of the clock time (either external clock or the RC Oscillator within the SLG46120). The sum of the number of DFF cells used will be the total time delay of the Pipe Delay logic cell.

## 10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells

There are two macrocells that can serve as either a 4-bit LUT or as a Counter / Delay. When used to implement LUT functions, the 4-bit LUT takes in four input signals from the connection matrix and produces a single output, which goes back into the connection matrix. When used to implement 8-Bit Counter / Delay function, two of the four input signals from the connection matrix go to the external clock (ext\_clk) and reset (DLY\_n/CNT\_Reset) for the counter/delay, with the output going back to the connection matrix.

## 10.5 Programmable Delay / Edge Detector

The SLG46120 has a programmable time delay logic cell available that can generate a delay that is selectable from one of four timings (time1) configured in the GreenPAK Designer. The programmable time delay cell can generate one of four different delay patterns, rising edge detection, falling edge detection, both edge detection and both edge delay. These four patterns can be further modified with the addition of delayed edge detection, which adds an extra unit of delay as well as glitch rejection during the delay period. See the timing diagrams below for further information.

*Note: The input signal must be longer than the delay, otherwise it will be filtered out.*

10.7 Deglitch Filter

The SLG46120 has an additional logic function that is connected directly to the Connection Matrix inputs and outputs. There is one deglitch filter.

Figure 23. Deglitch Filter

### 11.0 Analog Comparators (ACMP)

There are two Analog Comparator (ACMP) macrocells in the SLG46120. In order for the ACMP cells to be used in a GreenPAK design, the power up signals (ACMP0\_pdb and ACMP1\_pdb) need to be active. By connecting to signals coming from the Connection Matrix, it is possible to have each ACMP be on continuously, off continuously, or switched on periodically based on a digital signal coming from the Connection Matrix. When ACMP is powered down, output is low.

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage before connection to the analog comparator. Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by way of the external sources.

Each of the ACMP cells has a selection for the bandwidth of the input signal, which can be used to save power when low bandwidth signals are input into the analog comparator. And if input frequency > 200 kHz, the output will retain its previous value. Each cell also has a hysteresis selection, to offer hysteresis of 0 mV, 25 mV, 50 mV or 200 mV.

During powerup, the ACMP output will remain low, and then become valid 110 μs (max) after POR signal goes high, see *Figure 24*.

*Note: Applies to first time power ON.*

*Note: Regulator and Charge Pump set to automatic ON/OFF.*

**Figure 24. Maximum Power On Delay vs. VDD.**

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage (1X, 0.5X, 0.33X, 0.25X) before connection to the analog comparator. The Gain divider is unbuffered and consists of 250 KΩ (typ.) resistors, see *Table 49*. For gain divider accuracy refer to *Table 50*. IN- voltage range: 0 - 1.2 V. Can use Vref selection VDD/4 and VDD/3 to maintain this input range.

**Table 49. Gain Divider Input Resistance (typ).**

Gain	1X	0.5X	0.33X	0.25X
Input Resistance	100M	1M	0.75M	1M

**Table 50. Gain Divider Accuracy.**

Gain	0.5X	0.33X	0.25X
Accuracy	±0.6%	±0.9%	±0.28%

Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by the external reference/source. Internal Vref accuracy is optimized near 1000 mV selection.

*Note: Power supply control options have influence on the ACMP operation.*

*Note: Any ACMP powered on enables the BandGap internal circuit as well. An analog voltage will appear on Vref (even when the Force BandGap option is set as Disabled).*

Analog comparators have the following configurable options:

- Hysteresis: Input signal hysteresis options are Disable, 25 mV, 50 mV, 200 mV.
- Low Bandwidth: Enable, Disable;
- IN+ Gain: 1X, 0.5X, 0.33X, 0.25X;
- IN+ source:
  - ACMP0 IN+ options are PIN 3, VDD;
  - ACMP1 IN+ options are PIN 6, ACMP0 IN+;
- IN- source:
  - ACMP0 IN- options are 24 internal reference sources (50 mV – 1200 mV) and VDD/3, VDD/4, PIN 4;
  - PWR UP=0 – ACMP is powered down; PWR UP=1 – ACMP is powered up.

All ACMPs can have a common negative input. This can be achieved by configuring ACMP0 PIN 4 analog I/O connection.

### 12.0 Counters/Delay Generators (CNT/DLY)

There are two configurable counters/delay generators in the SLG46120. CNT/DLY0 is 14-bit and CNT/DLY1 is 8-bit. For flexibility, each of these macrocells has a large selection of internal and external clock sources, as well as the option to chain from the output of the previous (N-1) CNT/DLY macrocell, to implement longer count / delay circuits.

One of the counter/delay generator macrocells (CNT/DLY1) has two inputs from the connection matrix, one for Delay Input/Reset Input (Delay\_In/Reset\_In), and one for an external counter/clock source.

Note that there are also two Combination Function Macrocells that can be implemented as either 4-bit LUTs or 8-bit counter / delays, For more information please see Section 10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells.

## 13.0 Voltage Reference (VREF)

### 13.1 Voltage Reference Overview

The SLG46120 has a Voltage Reference Macrocell to provide references to the four analog comparators. This macrocell can supply a user selection of fixed voltage references,  $/3$  and  $/4$  reference off of the  $V_{DD}$  power supply to the device, and externally supplied voltage references from Pin 4. The macrocell also has the option to output reference voltages on pins 10. See table below for the available selections for each analog comparator. Also see *Figure 43* below, which shows the reference output structure.

## 14.0 RC Oscillator (RC Osc)

### 14.1 RC Oscillator Overview

The SLG46120 has two internal RC oscillators, one that runs at 25 kHz and one that runs at 2 MHz. When using the chip internal RC OSC, a choice is available to “Force Power On”, meaning that the RC OSC will always run, or “Auto Power On”, meaning that the RC OSC will have an associated startup and settling time associated with it (offset). *Figure 44* and *Figure 45* show maximum power on delay vs. VDD.

*Note: RC OSC power setting: "Auto Power On".*

Figure 44. Maximum Power On Delay vs. VDD, RC OSC = 2 MHz.

Figure 45. Maximum Power On Delay vs. VDD, RC OSC = 25 kHz.

The user can select one of these fundamental frequencies for the RC OSC Macrocell, or the fundamental frequency can also come from an external clock input (Pin 12). There are two divider stages that allow the user flexibility for introducing clock signals on various Connection Matrix Input lines. The first stage divider (also known as the clock pre-divider) allows the selection of /1, /2, /4 or /8 divide down frequency from the fundamental. There are two second stage divider controls (OUT0 and OUT1). Each has its own input of one frequency from the first stage divider, and outputs two different frequencies on Connection Matrix Input lines <30>, and <31>. See *Figure 46* below for details of the frequencies for each of these five Connection Matrix Inputs.

If PWR DOWN input of oscillator is LOW, the oscillator will be turned on. If PWR DOWN input of oscillator is HIGH the oscillator will be turned off. The PWR DOWN signal has the highest priority.

### 14.2 RC OSC Block Diagram

**Figure 46. RC OSC Block Diagram**

## 15.0 Power On Rest (POR)

The SLG46120 has a power-on reset (POR) macrocell to ensure correct device initialization and operation of all macrocells in the device. The purpose of the POR circuit is to have consistent behavior and predictable results when the VDD power is first ramping to the device, and also while the VDD is falling during power-down. To accomplish this goal, the POR drives a defined sequence of internal events that trigger changes to the states of different macrocells inside the device, and finally to the state of the I/O pins. This application note is created to explain the whole process of POR operation and GreenPAK chip behavior during the time while it is powering up and powering down.

### 15.1 General Operation

The SLG46120 is guaranteed to be powered down and nonoperational when the VDD voltage (voltage on PIN1) is less than 0.6V, but not less than -0.6 V. Another essential condition for the chip to be powered down is that no voltage higher (see Note 1) than the VDD voltage is applied to any other PIN. For example, if VDD voltage is 0.3 V, applying a voltage higher than 0.3V to any other PIN is incorrect, and can lead to incorrect or unexpected device behavior.

*Note 1. There is a 0.6 V margin due to forward drop voltage of the ESD protection diodes.*

To start the POR sequence in the SLG46120, the voltage applied on the VDD should be higher than the Power\_ON threshold (see Note 2). The full operational VDD range for the SLG46120 is 1.71V – 5.5V (1.8V  $\pm$ 5% - 5V $\pm$ 10%). This means that the VDD voltage must ramp up to the operational voltage value, but the POR sequence will start earlier, as soon as the VDD voltage rises to the Power\_ON threshold. After the POR sequence has started, the SLG46120 will have a typical period of time to go through all the steps in the sequence (noted in the datasheet for that device), and will be ready and completely operational after the POR sequence is complete.

*Note 2. The Power\_ON threshold can vary by PVT, but typically it is 1.6V.*

To power down the chip the VDD voltage should be lower than the operational and to guarantee that chip is powered down it should be less than 0.6 V.

All PINs are in high impedance state when the chip is powered down and while the POR sequence is taking place. The last step in the POR sequence releases the I/O structures from the high impedance state, at which time the device is operational. The pin configuration at this point in time is defined by the design programmed into the chip. Also as it was mentioned before the voltage on PINs can't be bigger than the VDD, this rule also applies to the case when the chip is powered on.

### 15.2 POR Sequence

The POR system generates a sequence of signals that enable certain macrocells. The sequence is shown in *Figure 47*.

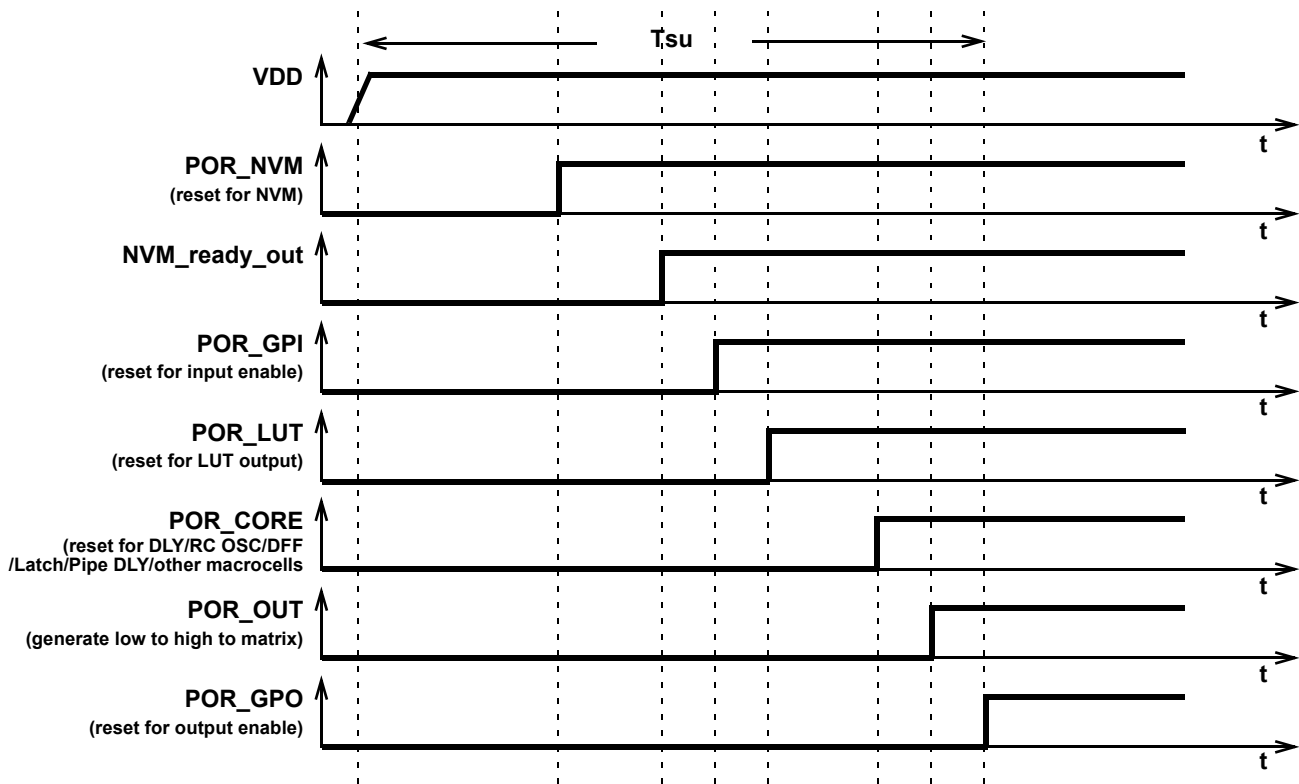

Figure 47. POR sequence

As can be seen from *Figure 47* after the VDD has start ramping up and crosses the Power\_ON threshold, first, the on-chip NVM memory is reset. Next the chip reads the data from NVM, and transfers this information to SRAM registers that serve to configure each macrocell, and the Connection Matrix which routes signals between macrocells. The third stage causes the reset of the input pins, and then to enable them. After that, the LUTs are reset and become active. After LUTs the Delay cells, RC OSC, DFFs, Latches and Pipe Delay are initialized. Only after all macrocells are initialized internal POR signal (POR macrocell output) goes from LOW to HIGH. The last portion of the device to be initialized are the output PINs, which transition from high impedance to active at this point.

The typical time that takes to complete the POR sequence varies by device type in the GreenPAK family. It also depends on many environmental factors, such as: slew rate, VDD value, temperature and even will vary from chip to chip (process influence).

## 15.3 Macrocells Output States During POR Sequence

To have a full picture of SLG46120 operation during powering and POR sequence, review the overview the macrocell output states during the POR sequence (*Figure 48* describes the output signals states).

First, before the NVM has been reset, all macrocells have their output set to logic LOW (except the output PINs which are in high impedance state). Before the NVM is ready, all macrocell outputs are unpredictable (except the output PINs). On the next step, some of the macrocells start initialization: input pins output state becomes LOW; LUTs also output LOW. Only P DLY macrocell configured as edge detector becomes active at this time. After that input PINs are enabled. Next, only LUTs are configured. Next, all other macrocells are initialized. After macrocells are initialized, internal POR matrix signal switches from LOW to HIGH. The last are output PINs that become active and determined by the input signals.

## 22.0 Revision History

Date	Version	Change
10/10/2017	1.08	Updated Electrical Spec Fixed typos Updated POR sequence
7/7/2017	1.07	Updated Section Programmable Delay / Edge Detector Fixed typos Updated Electrical Spec
12/22/2016	1.06	Fixed typos Updated Silego Website & Support
5/30/2016	1.05	Updated Silego Website & Support Updated Programmable Delay information Added $PON_{THR}$ and $POFF_{THR}$ in Electrical Spec
10/28/2015	1.04	Updated Absolute maximum conditions
10/20/2015	1.03	Fixed typos
8/11/2015	1.02	Fixed Programmable delay values in Section 7.0
7/23/2015	1.01	Updated User Programmability Updated Register Table for clarification
5/26/2015	1.0	Production Release
5/21/2015	0.59	Updated ACMP Diagrams and added Timing Characteristics Diagrams
4/23/2015	0.58	Updated ACMP section
4/9/2015	0.57	Updated Tsu condition and value
3/27/2015	0.56	Updated ACMP section Updated RC Oscillator section
3/10/2015	0.55	Added Connection Matrix Example
3/9/2015	0.54	Added POR section
2/10/2015	0.53	Fixed Preliminary watermark
1/14/2015	0.52	Added IDD Estimator, Timing Estimator, Expected Delays sections
12/3/2014	0.51	Updated Electrical Characteristics VIH/VIL/VOH/VOL values
9/26/2014	0.50	Preliminary Release
9/24/2014	0.27	Fixed typos
8/11/2014	0.26	Updated package information Added Recommended Land Pattern
7/29/2014	0.25	Fixed ESD information
6/20/2014	0.24	Updated Electrical Specifications VIH/VIL levels Fixed typos
5/21/2014	0.23	Updated block diagram Fixed typos Updated Pipe Delay information Moved Programmable Delay and Deglitch Filter to Combination Macrocells section
4/29/2014	0.22	Added ESD Ratings and MSL to Absolute Maximum Conditions
4/15/2014	0.21	Updated block diagrams and timing diagrams for clarity
2/12/2014	0.2	Added Macrocell Function Sections
1/16/2014	0.11	Added Register Table
9/16/2013	0.1	Initial release

## Silego Website & Support

### Silego Technology Website

Silego Technology provides online support via our website at <http://www.silego.com/>. This website is used as a means to make files and information easily available to customers.

For more information regarding Silego Green products, please visit our website.

Our Green product lines feature:

GreenPAK: Programmable Mixed Signal Matrix products

GreenFET1 / GreenFET3 / HFET1: MOSFET Drivers and ultra-small, low RDSon Load Switches

GreenCLK1 / GreenCLK2 / GreenCLK3: Crystal replacement technology

Products are also available for purchase directly from Silego at the Silego Online Store at <http://www.silego.com/buy/>.

### Silego Technical Support

Datasheets and errata, application notes and example designs, user guides, and hardware support documents and the latest software releases are available at the Silego website or can be requested directly at [info@silego.com](mailto:info@silego.com).

For specific GreenPAK design or applications questions and support please send e-mail requests to [GreenPAK@silego.com](mailto:GreenPAK@silego.com)

Users of Silego products can receive assistance through several channels:

### Contact Your Local Sales Representative

Customers can contact their local sales representative or field application engineer (FAE) for support. Local sales offices are also available to help customers.
