### 1.2 MIC2133 OVERVIEW

MIC2133 is constant on-time, dual phase synchronous buck controller featuring a unique adaptive ON-time control architecture with HyperLight Load and phase-shedding features enabled. MIC2133 can be used with external MOSFETs and output filter to create a dual phase single output, high current switch mode power supply. It also operates over an input supply range from 4.5V to 75V and can be used to supply up to 50A of output current. The output voltage is adjustable down to 0.6V with a guaranteed accuracy of  $\pm 1\%$ . The device operates with programmable switching frequency from 100 kHz to 800 kHz per phase. MIC2133 is available in a 5 x 5 mm 32-pin VQFN package with a junction operating range from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

The 75V rating of this device makes it attractive for applications such as communication, automotive and industrial, which have increasing requirements for additional voltage safety headroom.

NOTES:

## Chapter 2. Installation and Operation

### 2.1 INTRODUCTION

The MIC2133 Evaluation Board (EV66P64A) is fully assembled and tested to evaluate and demonstrate the MIC2133 capabilities. The board is based on a buck topology and can deliver an adjustable output voltage between 1.5V and 5V, with a maximum current of 50A when is supplied with 10-75V at the input. It should be noted, however, that the board is tuned and optimized for a 5V/15A output.

#### 2.1.1 Powering the MIC2133 Evaluation Board

The board's power supply requires an output capability of at least 1A and a voltage range of 10 to 75V, at a minimum of 100W. A proper resistor or an electronic load device capable to sustain output voltage and current can be used as a load (see [Figure 2-1](#)).

**FIGURE 2-1:** MIC2133 Evaluation Board (EV66P64A) Connection Diagram.

# MIC2133 Evaluation Board User's Guide

## 2.2 SETUP AND CONFIGURATION

### 2.2.1 IC

To enable IC, a jumper should be placed vertically on J10, (between the J10-1 and J1-2 connectors, as in [Figure 2-1](#)).

### 2.2.2 LDO

To use the internal high voltage LDO, a jumper should be placed on connectors J2-2 and J2-3 else.

To use an external power supply, the same jumper must be removed and an external voltage in the range of 4.7V to 13V should be supplied to the EXTVDD and AGND connectors.

To bypass the internal high voltage LDO, a jumper should be placed between the J2-1 (VOUT) and J2-2 (EXTVDD) connectors, if the output voltage is greater than 4.7V.

### 2.2.3 Voltage

The board's output voltage (either 1.5V, 1.8V, 2.5V, 3.3V, or 5V) is set by placing jumpers in the desired configuration. The selection for the desired output voltage can be made by plugging a jumper in the vertical position on the J8 connector (as in the table in the top left of the board) and a jumper must be placed vertically on the J18 connector, on its first right hand position.

**Note:** With no jumper on the J8 connector, the default output voltage is 5V.

#### EXAMPLE 2-1: CALCULATION OF $R_{ILIM}$ FOR BOTTOM MOSFET $R_{DSON}$ CURRENT SENSING

$$I_{LIM} = \frac{0.3V - (0.25 \cdot V_{ILIM})}{R_{DSON}} \quad (1)$$
$$V_{ILIM} = 1.2V - (4 \cdot R_{DSON} \cdot I_{LIM}) \quad (2)$$

For  $I_{LIM} = 15A$  per phase,  $R_{DSON} = 10m\Omega$  at  $25^{\circ}C$ , using equation (2)  $V_{ILIM} = 1.2V - 4 * 10m\Omega * 15A$ .

$V_{ILIM} = 0.6V$ , to get on  $I_{LIM}$  pin at  $10 \mu A$  constant over temperature current we need a programming equivalent resistor of  $R_{ILIM} = 0.6V/10 \mu A = 60 k\Omega$ .

#### EXAMPLE 2-2: CALCULATION OF THE FEEDBACK DIVIDER FOR 5V

$$R_{FB(BOT)} = \frac{R_{FB(TOP)}}{\frac{V_{OUT}}{V_{REF}} - 1} \quad (3)$$

For  $V_{OUT} = 5V$  with  $R_{FB(TOP)} = 22 k\Omega$  and  $V_{REF} = 0.6 V$ , using equation (3)  $R_{FB(BOT)} = 22 k\Omega / (5V/0.6V - 1)$  which results in  $R_{FB(BOT)} = 3 k\Omega$ .
